## 1

## INTERACTION EM FIELD-CRYSTAL

A crystal is a well ordered system composed by the same atoms or molecules, they are spatially arranged so as to form a regular lattice and where it is possible to identify an elementary cell. Crystals can be: good conductors, semiconductors and isolators as th quartz crystal. (Using an energy-band model of the crystal, there prevail the valence energy band and the conduction energy band, One verify that in a good conductor the two bands overlap and the electromagnetic field is reflected on its surface.
If the electromagnetic field is polarized, the electric field vector undergoes a reflection of $180^{\circ}$ so that, on the metallic surface the electric field vector is null. In the same point, instead, the magnetic component of the field doubles. Indeed there is no electromagnetic propagation in metals. In a semiconductor, however, there is a limited gap between the two bands, while in an insulator the energy gap is much greater than that of a semiconductor). A dielectric, instead, is an isolator, it can be a non conducting crystal but also a disordered system of atoms or molecules (no lattice) for example an amorphous substance (formed by some organic molecules carbon compounds, or polymers) or glass formed, for example, by non crystallized silicon dioxide. Tl electromagnetic field propagates through semiconductors and dielectrics. In the following pages, it will be analyzed the interaction between a polarized electromagnetic field propagating through the crystal. As will be seen, the propagation occur only within a certain frequency band of the EM field, this band depends on the medium in which the EM wave propagates. (In other words there are crystals transparent to the visible light, other are opaque to the visible light but transparent at infrared frequency $(\mathrm{Ge}, \mathrm{Si}$ and so on).

## EM Field vectors' units of measure

Magnetic induction $\mathbf{B}$ unit measure is: $\quad \mathrm{T}=\frac{\mathrm{Wb}}{\mathrm{m}^{2}}=\frac{\mathrm{H}}{\mathrm{m}} \cdot \frac{\mathrm{A}}{\mathrm{m}} \quad 1 \cdot \frac{\mathrm{~Wb}}{\mathrm{~m}^{2}}=1 \mathrm{~T} \quad 1 \cdot \mathrm{~T}=1 \cdot \frac{\mathrm{H}}{\mathrm{m}^{2}} \cdot \mathrm{~A}$
Magnetic field intensity $\mathbf{H}$ :
$\frac{\mathrm{A}}{\mathrm{m}}=1 \cdot \frac{\mathrm{~Wb}}{\mathrm{~m} \cdot \mathrm{H}}$
$\mathrm{Oe}=79.577 \frac{\mathrm{~A}}{\mathrm{~m}}$
$1 \cdot \frac{\mathrm{~A}}{\mathrm{~cm}}=1.26 \cdot \mathrm{Oe}$
Electric field intensity $\mathbf{E}$ :
$\frac{\mathrm{volt}}{\mathrm{m}}=1 \cdot \frac{\mathrm{~Wb}}{\mathrm{~m} \cdot \mathrm{~s}}$
$\frac{\mathrm{volt}}{\mathrm{m}}=1 \cdot \frac{\mathrm{~T} \cdot \mathrm{~m}}{\mathrm{~s}}$
$\frac{\mathrm{volt}}{\mathrm{m}}=12.566 \cdot \frac{\mathrm{Oe} \cdot \mathrm{mH}}{\mathrm{s}}$
Dielectric constant of the vacuum: $\quad \varepsilon_{0}=8.854 \cdot \frac{\mathrm{pF}}{\mathrm{m}}$
Magnetic permeability of the vacuum
$\mu_{0}=1.257 \cdot \frac{\mu H}{m}$
$\frac{\mu \mathrm{H}}{\mathrm{m}}=79.577 \cdot \frac{\mu \mathrm{~T}}{\mathrm{Oe}}$
$\mu_{0}=100 \cdot \frac{\mu \mathrm{~T}}{\mathrm{Oe}}$
Electron charge:
$\mathrm{q}_{\mathrm{e}}=1.602 \times 10^{-19} \mathrm{C}$

Electric displacement $\mathbf{D}$ :
$\frac{\mathrm{F}}{\mathrm{m}} \cdot \frac{\mathrm{volt}}{\mathrm{m}}=1 \frac{\mathrm{~A} \cdot \mathrm{~s}}{\mathrm{~m}^{2}}$
Electric current density $\mathbf{J}_{\boldsymbol{\sigma}}$ :
$\frac{\mathrm{A}}{\mathrm{m}^{2}}$
Magnetic current density $\mathbf{J}_{\mathbf{m}}$ :

$$
\frac{\mathrm{V}}{\mathrm{~m}^{2}}=\frac{\mathrm{Wb}}{\mathrm{~m}^{2} \cdot \mathrm{~s}}=\frac{\mathrm{T}}{\mathrm{~s}}
$$

$1 \cdot \frac{\mathrm{~V}}{\mathrm{~m}^{2}}=1 \cdot \frac{\mathrm{~T}}{\mathrm{~s}}$
$1 \cdot \frac{\mathrm{~V}}{\mathrm{~m}^{2}}=1 \cdot \frac{\mathrm{~Wb}}{\mathrm{~m}^{2} \cdot \mathrm{~s}}$
Unit of measure of the Magnetic vector potential $\mathbf{A}$
If you choose (Electromagnetics, Option 1)) $\mathbf{B}(\mathrm{r}, \mathrm{t})=\nabla \times \mathbf{A}(\mathrm{r}, \mathrm{t})$, unit of measure: $[\mathbf{A}]=\frac{\mathrm{Wb}}{\mathrm{m}}$.
If you choose (Electromagnetics, Option 2)) $\mathbf{H}(\mathbf{r}, \mathrm{t})=\nabla \times \mathbf{A}(\mathbf{r}, \mathrm{t})$, then the unit of measure is [ $\mathbf{A}]=$ Ampère.

## Dipole approximation

Dipoles in a crystal lattice $\lambda \gg \mathrm{a}$
The electric field is linked to the vector potential by the relation a6):

$$
\begin{align*}
& \frac{\text { volt }}{\mathrm{m}} \mathbf{E ( r , t ) = - \nabla \varphi ( \mathrm { r } , \mathrm { t } ) - \frac { \partial } { \partial \mathrm { t } } \mathbf { A } ( \mathrm { r } , \mathrm { t } )} \frac{\mathrm{~Wb}}{\mathrm{~m} \cdot \mathrm{~s}}=1 \cdot \frac{\mathrm{volt}}{\mathrm{~m}} \\
& \text { if } \varphi(\mathbf{r}, \mathrm{t})=\text { constant, } \mathbf{E}(\mathbf{r}, \mathrm{t})=-\frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathrm{r}, \mathrm{t})
\end{align*}
$$

furthermore the time derivative of the vector potential can be rewritten as the following scalar product:

$$
\frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathrm{r}, \mathrm{t})=\frac{\partial}{\partial \mathbf{r}} \mathbf{A}(\mathrm{r}, \mathrm{t}) \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{r}=\mathrm{v} \cdot \nabla \mathbf{A}(\mathrm{r}, \mathrm{t})
$$

$\square A(r, t)$ time derivative
where $r$ is the position, at time $t$, of the vector potential.

$$
\text { if } \varphi(\mathbf{r}, \mathrm{t})=\text { constant, } \mathbf{E}(\mathbf{r}, \mathrm{t})=-\frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathrm{r}, \mathrm{t})=-\mathbf{v} \cdot \nabla \mathbf{A}(\mathrm{r}, \mathrm{t})
$$

Qunites of measure

Considering the propagation of time harmonic fields, the vector $\mathbf{v}$ is the speed of the EM field through the lattice, namely slightly less than the light speed $c$, that is $|\mathbf{v}|=\frac{c}{\eta}$, where $\eta$ is the refraction index of the crystal. The propagation direction, for time harmonic field, is that of the wave vector $\mathbf{k}$ with unit vector $\frac{\mathbf{k}}{|\mathbf{k}|}$ orthogonal to $\mathbf{A}(\mathbf{r}$,

Namely $\mathbf{v}=\frac{\mathrm{c}}{\eta} \cdot \frac{\mathbf{k}}{|\mathbf{k}|}$ ．

回A，E，H
Substituting 4）in 3）I get：

$$
\mathbf{E}(\mathbf{r}, \mathrm{t})=-\nabla \varphi(\mathrm{r}, \mathrm{t})-\mathbf{v} \cdot \nabla \mathbf{A}(\mathrm{r}, \mathrm{t})
$$

Dunites of measure
furthermore，collecting the gradient operators，considering $\mathbf{v}$ constant，I can write：

$$
\mathbf{E}(\mathbf{r}, \mathrm{t})=-\nabla(\varphi(\mathbf{r}, \mathrm{t})+\mathbf{v} \cdot \mathbf{A}(\mathbf{r}, \mathrm{t}))=-\nabla(\Phi)
$$

so that I can define the scalar potential：$\Phi(\mathbf{r}, \mathrm{t})=\varphi(\mathbf{r}, \mathrm{t})+\mathbf{v} \cdot \mathbf{A}(\mathbf{r}, \mathrm{t}) \quad \mathbf{v}$ constant

$$
\text { while the potential energy is } \mathrm{U}(\mathbf{r}, \mathrm{t})=-\mathrm{q}_{\mathrm{e}} \cdot(\varphi(\mathbf{r}, \mathrm{t})+\mathbf{v} \cdot \mathbf{A}(\mathbf{r}, \mathrm{t})) \quad \mathrm{q}_{\mathrm{e}}=1.602 \times 10^{-19} \mathrm{C}
$$

which is useful to define the Lagrangian（see below）．

$$
\text { if } \begin{aligned}
\varphi(\mathbf{r}, \mathrm{t})=\text { constant, } \mathbf{E}(\mathbf{r}, \mathrm{t}) & =-\frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathbf{r}, \mathrm{t})=-\mathbf{v} \cdot \nabla \mathbf{A}(\mathbf{r}, \mathrm{t}) \\
\Phi(\mathbf{r}, \mathrm{t}) & =\mathbf{v} \cdot \mathbf{A}(\mathbf{r}, \mathrm{t}) \\
\mathrm{U}(\mathbf{r}, \mathrm{t}) & =-\mathrm{q}_{\mathrm{e}} \cdot \mathbf{v} \cdot \mathbf{A}(\mathbf{r}, \mathrm{t}) \quad \mathbf{v} \text { constant }
\end{aligned}
$$

All that I＇ve sad till now is related to the electromagnetic field．But，to study the interactions wave－materials，I have know the dynamics of one atom of the crystal lattice that，subjected to a em field whose wavelength $\lambda$ is much greate than the reticular constant，here indicated with letter a，causes the single atom to behave like a dipole．
＠Taylor series of the EM vector potential A（moving at light speed）
TLagrange equations system
回Approximations for small movements
風－Example：System with two degree of freedom
■The Lagrangian within the Gauss System
Consider as Lagrangian coordinates，the position $q$ ，and the momentum $\mathrm{p}=\mathrm{m} \cdot \mathrm{q}^{\prime}, \mathrm{q}^{\prime}=\mathrm{v}$ ．
Electric potential at $\mathrm{q}: \varphi(\mathrm{q}, \mathrm{t})$ ，while the potential energy is $\mathrm{U}(\mathrm{q}, \mathrm{t})=-\mathrm{q}_{\mathrm{e}} \cdot\left(\varphi(\mathrm{q}, \mathrm{t})+\mathbf{q}^{\prime} \cdot \mathbf{A}(\mathrm{r}, \mathrm{t})\right)$
The Lagrangian of the system I deal with is：
$\mathrm{q}_{\mathrm{e}}=1.602 \times 10^{-19} \mathrm{C} \quad \mathscr{L}\left(\mathrm{q}, \mathrm{q}^{\prime}, \mathrm{t}\right)=\frac{1}{2} \cdot \mathrm{p} \cdot \mathrm{q}^{\prime}+\mathrm{q}_{\mathrm{e}} \cdot \varphi(\mathrm{q})+\mathrm{q}_{\mathrm{e}} \cdot \mathbf{q}^{\prime} \cdot \mathbf{A}(\mathbf{r}, \mathrm{t})$
For one dipole＇s electron，the Lagrange equation is：$\frac{\mathrm{d}}{\mathrm{dt}} \frac{\partial}{\partial \mathbf{q}^{\prime}} \mathscr{L}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)-\frac{\partial}{\partial \mathbf{q}} \mathscr{L}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=0$
Remark：
If I define the new Lagrangian $\mathscr{L}_{1}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=\mathscr{L}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)+\mathrm{f}(\mathrm{t})$ ，the differential equation doesn＇t varies，indeed：

$$
\frac{\mathrm{d}}{\mathrm{dt}} \frac{\partial}{\partial \mathbf{q}^{\prime}}\left(\mathscr{L}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)+\mathrm{f}(\mathrm{t})\right)-\frac{\partial}{\partial \mathbf{q}}\left(\mathscr{L}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)+\mathrm{f}(\mathrm{t})\right)=\frac{\mathrm{d}}{\mathrm{dt}} \frac{\partial}{\partial \mathbf{q}^{\prime}} \mathscr{L}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)-\frac{\partial}{\partial \mathbf{q}} \mathscr{L}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)
$$

since $f(t)$ isn＇t a function of $\mathbf{q}$ and $\mathbf{q}^{\prime} \frac{\partial}{\partial \mathbf{q}^{\prime}} f(t)=0 \quad$ and $\frac{\partial}{\partial \mathbf{q}} f(t)=0$
Accordingly I can add，to the Lagrangian $\mathscr{L}$ ，the arbitrary，but useful term $-\mathrm{q}_{\mathrm{e}} \cdot \frac{\partial}{\partial \mathrm{t}}(\mathbf{q} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t}))$ without affecting th
analysis of the dynamic behavior of the system (because q is almost constant and A vary very slowly in space, it follows that the result is a function of the time only so that $\frac{\partial}{\partial q^{\prime}} \frac{\partial}{\partial \mathrm{t}}(\mathbf{q} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t}))=0$ and $\frac{\partial}{\partial \mathrm{q}} \frac{\partial}{\partial \mathrm{t}}(\mathbf{q} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t}))=0$.

$$
\text { I can write: } \quad \mathscr{L}_{1}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=\mathscr{L}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)-\mathrm{q}_{\mathrm{e}} \cdot \frac{\partial}{\partial \mathrm{t}}(\mathbf{q} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t}))
$$

after a substitution of 11) $\mathscr{L}_{\boldsymbol{1}}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}+\mathrm{q}_{\mathrm{e}} \cdot \mathrm{V}(\mathbf{q})+\mathrm{q}_{\mathrm{e}} \cdot \mathbf{q}^{\mathbf{\prime}} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t})-\mathrm{q}_{\mathrm{e}} \cdot \frac{\partial}{\partial \mathrm{t}}(\mathbf{q} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t}))$

$$
\text { the partial derivatives is } \frac{\partial}{\partial \mathrm{t}}(\mathbf{q} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t}))=\mathbf{A}(\mathbf{q}, \mathrm{t}) \cdot \mathbf{q}^{\prime}+\mathbf{q} \cdot \frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathbf{q}, \mathrm{t})
$$

which substituted in 15) gives:

$$
\begin{array}{r}
\mathscr{L}_{\boldsymbol{1}}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}+\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathbf{q})+\mathrm{q}_{\mathrm{e}} \cdot \mathbf{q}^{\prime} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t})-\mathrm{q}_{\mathrm{e}} \cdot\left(\mathbf{A}(\mathbf{q}, \mathrm{t}) \cdot \mathbf{q}^{\prime}+\mathbf{q} \cdot \frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathbf{q}, \mathrm{t})\right) \\
\text { or } \quad \mathscr{L}_{\boldsymbol{\jmath}}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}+\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathbf{q})+\mathrm{q}_{\mathrm{e}} \cdot \mathbf{q}^{\prime} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t})-\mathrm{q}_{\mathrm{e}} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t}) \cdot \mathbf{q}^{\prime}-\mathrm{q}_{\mathrm{e}} \cdot \mathbf{q} \cdot \frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathbf{q}, \mathrm{t})
\end{array}
$$

simplifying, I get:

$$
\mathscr{L}_{1}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}+\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathbf{q})-\mathrm{q}_{\mathrm{e}} \cdot \mathbf{q} \cdot \frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathbf{q}, \mathrm{t})
$$

Consider an EM plane wave propagating through the crystal along a path aligned with the optical axis z . This implif that the electromagnetic field is orthogonal to the z propagation direction. As a result I indicate the electric field as transversal:

$$
\mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})=-\nabla \varphi(\mathbf{q}, \mathrm{t})-\frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathbf{q}, \mathrm{t})
$$

which, for a space constant potential $\varphi$, simplify to:

$$
\frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathbf{q}, \mathrm{t})=-\mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t}) \text { transversal electric field intensity }
$$

$$
\mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})=\mathrm{E}_{\mathrm{x}}(\mathrm{x}, \mathrm{y}, \mathrm{z}, \mathrm{t}) \cdot \mathbf{i}_{\mathbf{x}}+\mathrm{E}_{\mathrm{y}}(\mathrm{x}, \mathrm{y}, \mathrm{z}, \mathrm{t}) \cdot \mathbf{i}_{\mathbf{y}}+0 \cdot \mathbf{i}_{\mathbf{z}}
$$

the Lagrangian 19), finally, is: $\mathscr{L}_{1}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}+\mathrm{q}_{\mathrm{e}} \cdot \mathrm{V}(\mathbf{q})+\mathrm{q}_{\mathrm{e}} \cdot \mathbf{q} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})$
DTime harmonic Field decomposition
for n electrons I get: $\quad \mathscr{L}_{1}=\frac{1}{2} \cdot \sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathbf{p}_{\mathbf{i}} \cdot \mathbf{q}_{\mathbf{i}}^{\mathbf{i}}\right)+\mathrm{q}_{\mathrm{e}} \cdot \sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{V}\left(\mathbf{q}_{\mathbf{i}}\right)+\mathrm{q}_{\mathrm{e}} \cdot \sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathbf{q}_{\mathbf{i}} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})\right)$
The modified Lagrangian correspondingly is:

$$
\mathscr{L}_{\boldsymbol{l}}=\sum_{\mathrm{i}=1}^{\mathrm{n}}\left[\frac{1}{2} \cdot\left(\mathbf{p}_{\mathbf{i}} \cdot \mathbf{q}_{\mathbf{i}}^{\mathbf{i}}\right)+\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}\left(\mathbf{q}_{\mathbf{i}}\right)+\mathrm{q}_{\mathrm{e}} \cdot \mathbf{q}_{\mathbf{i}} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})\right]
$$

For one particle with electric charge Q , I get:

$$
\begin{aligned}
& \mathrm{U}(\mathbf{q}, \mathrm{t})=\mathrm{Q} \cdot\left(\varphi(\mathbf{q}, \mathrm{t})+\mathbf{q}^{\prime} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t})\right) \\
& \mathscr{L}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}-\mathrm{Q} \cdot \mathrm{~V}(\mathbf{q})-\mathrm{Q} \cdot \mathbf{q}^{\prime} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t})
\end{aligned}
$$

$$
\begin{aligned}
& \mathscr{L}_{1}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=\mathscr{L}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)+\mathrm{Q} \cdot \frac{\partial}{\partial \mathrm{t}}(\mathbf{q} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t})) \\
& \mathscr{L}_{1}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}-\mathrm{Q} \cdot \mathrm{~V}(\mathbf{q})-\mathrm{Q} \cdot \mathbf{q}^{\prime} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t})+\mathrm{Q} \cdot \frac{\partial}{\partial \mathrm{t}}(\mathbf{q} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t})) \\
& \frac{\partial}{\partial \mathrm{t}}(\mathbf{q} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t}))=\mathbf{A}(\mathbf{q}, \mathrm{t}) \cdot \mathbf{q}^{\prime}+\mathbf{q} \cdot \frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathbf{q}, \mathrm{t}) \\
& \mathscr{L}_{1}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}-\mathrm{Q} \cdot \mathrm{~V}(\mathbf{q})-\mathrm{Q} \cdot \mathbf{q}^{\prime} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t})+\mathrm{Q} \cdot\left(\mathbf{A}(\mathbf{q}, \mathrm{t}) \cdot \mathbf{q}^{\prime}+\mathbf{q} \cdot \frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathbf{q}, \mathrm{t})\right) \\
& \mathscr{L}_{1}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}-\mathrm{Q} \cdot \mathrm{~V}(\mathbf{q})-\mathrm{Q} \cdot \mathbf{q}^{\prime} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t})+\mathrm{Q} \cdot \mathbf{A}(\mathbf{q}, \mathrm{t}) \cdot \mathbf{q}^{\prime}+\mathrm{Q} \cdot \mathbf{q} \cdot \frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathbf{q}, \mathrm{t}) \\
& \mathscr{L}_{1}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}-\mathrm{Q} \cdot \mathrm{~V}(\mathbf{q})+\mathrm{Q} \cdot \mathbf{q} \cdot \frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathbf{q}, \mathrm{t}) \\
& \\
& \mathbf{E} \mathbf{T}(\mathbf{q}, \mathrm{t})=-\nabla \mathrm{V}(\mathbf{q}, \mathrm{t})-\frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathbf{q}, \mathrm{t})
\end{aligned}
$$

which, for a constant potential V, simplify to:

$$
\begin{gathered}
\frac{\partial}{\partial \mathrm{t}} \mathbf{A}(\mathbf{q}, \mathrm{t})=-\mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t}) \\
\mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})=\mathrm{E}_{\mathrm{x}}(\mathrm{x}, \mathrm{y}, \mathrm{z}, \mathrm{t}) \cdot \mathbf{i}_{\mathbf{x}}+\mathrm{E}_{\mathrm{y}}(\mathrm{x}, \mathrm{y}, \mathrm{z}, \mathrm{t}) \cdot \mathbf{i}_{\mathbf{y}} \quad \mathrm{E}_{\mathrm{Z}}(\mathrm{x}, \mathrm{y}, \mathrm{z}, \mathrm{t})=0 \\
\mathscr{L}_{1}\left(\mathbf{q}, \mathbf{q}^{\prime}, \mathrm{t}\right)=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}-\mathrm{Q} \cdot \mathrm{~V}(\mathbf{q})-\mathrm{Q} \cdot \mathbf{q} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})
\end{gathered}
$$

for n particles with electric charge Q , I get:

$$
\mathscr{L}_{1}=\sum_{\mathrm{i}=1}^{\mathrm{n}}\left[\frac{1}{2} \cdot\left(\mathrm{p}_{\mathrm{i}} \cdot \mathrm{q}_{\mathrm{i}}^{\prime}\right)-\mathrm{Q} \cdot \mathrm{~V}\left(\mathbf{q}_{\mathbf{i}}\right)-\mathrm{Q} \cdot \mathbf{q}_{\mathbf{i}} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})\right]
$$

## - Hamilton equations

## Classical Hamilton equations

Kinetic energy : T
Potential energy: U
Hamiltonian : $\mathscr{H}\left(\mathrm{q}_{1}, \mathrm{q}_{2}, \ldots \mathrm{q}_{\mathrm{n}}, \mathrm{p}_{1}, \mathrm{p}_{2}, \ldots \mathrm{p}_{\mathrm{n}}, \mathrm{t}\right)=\mathrm{T}+\mathrm{U}=2 \cdot \mathrm{~T}-\mathscr{L}\left(\mathrm{q}_{1}, \mathrm{q}_{2}, \ldots \mathrm{q}_{\mathrm{n}}, \mathrm{q}_{1}^{\prime}, \mathrm{q}_{2 . n}^{\prime}, \ldots \mathrm{q}^{\prime}, \mathrm{t}\right)$

$$
\begin{aligned}
& \mathscr{H}=\frac{1}{2} \cdot \sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{p}_{\mathrm{i}} \cdot \mathrm{q}_{\mathrm{i}}\right)+\mathrm{U} \\
& \mathscr{L}=\frac{1}{2} \cdot \sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{p}_{\mathrm{i}} \cdot \mathrm{q}_{\mathrm{i}}{ }_{\mathrm{i}}\right)-\mathrm{U}
\end{aligned}
$$

$$
\mathscr{H}=2 \cdot \mathrm{~T}-\mathscr{L}=2 \cdot \frac{1}{2} \cdot \sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{p}_{\mathrm{i}} \cdot \mathrm{q}_{\mathrm{i}}^{\prime}\right)-\mathscr{L}=\sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{p}_{\mathrm{i}} \cdot \mathrm{q}_{\mathrm{i}}^{\prime}\right)-\mathscr{L}=\sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{q}_{\mathrm{i}} \cdot \frac{\partial}{\partial \mathrm{q}_{\mathrm{i}}^{\prime}} \mathscr{L}\right)-\mathscr{L}
$$

The conjugated momenta can be written as functions of the Lagrangian $\mathrm{p}_{\mathrm{i}}=\frac{\partial}{\partial \mathrm{q}_{\mathrm{i}}^{\prime}} \mathscr{L}, \mathrm{i}=1,2,3 . . \mathrm{n}$

$$
\begin{gathered}
\mathscr{H}=\sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{p}_{\mathrm{i}} \cdot \mathrm{q}_{\mathrm{i}}^{\prime}\right)-\mathscr{L}=\sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{q}_{\mathrm{i}} \cdot \frac{\partial}{\partial \mathrm{q}_{\mathrm{i}}} \mathscr{L}\right)-\mathscr{L} \\
\mathscr{H}=\sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{q}_{\mathrm{i}} \mathrm{i} \cdot \frac{\partial}{\partial \mathrm{q}_{\mathrm{i}}^{\prime}} \mathscr{L}\right)-\mathscr{L}
\end{gathered}
$$

Hamilton equations:

$$
\mathrm{q}_{\mathrm{i}}^{\prime}=\frac{\partial}{\partial \mathrm{p}_{\mathrm{i}}} \mathscr{H} \quad \quad \mathrm{i}=1,2,3 . . \mathrm{n}
$$

$$
\mathrm{p}_{\mathrm{i}}=-\frac{\partial}{\partial \mathrm{q}_{\mathrm{i}}} \mathscr{H}
$$

$\Delta$ Hamilton equations
For one electron, the Hamiltonian is: $\mathscr{H}=\mathbf{p} \cdot \mathbf{q}^{\mathbf{\prime}}-\mathscr{L}_{\boldsymbol{1}}=\mathbf{p} \cdot \mathbf{q}^{\mathbf{\prime}}-\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\mathbf{\prime}}-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{V}(\mathbf{q})-\mathrm{q}_{\mathrm{e}} \cdot \mathbf{q} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})$

$$
\text { namely: } \quad \mathscr{H}=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathbf{q})-\mathrm{q}_{\mathrm{e}} \cdot \mathbf{q} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})
$$

The effect of the electromagnetic field acting on the crystal, is the polarization of each atom or molecule part of it.風 The electric dipole

Define the dipole moment as: $\mu=-q_{\mathrm{e}} \cdot \mathbf{d}$, which, substituted in the previous equation 25 ), yields:

$$
\mathscr{H}=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathbf{q})+\mu \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})
$$

( $\mu$ and $\mathbf{E}_{\mathbf{T}}$ are aligned only for isotropic materials) In this relation (27)) I distinguish three Hamiltonians:

$$
\text { Unperturbed Hamiltonian: } \quad \mathscr{H}_{0}=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}
$$

Relaxation Hamiltonian: $\quad \mathscr{H}_{z}=-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{V}(\mathbf{q})$
Interaction Hamiltonian: $\quad \mathscr{H}_{1}=\mu \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})$

$$
\text { that is: } \quad \mathscr{H}=\mathscr{H}_{0}+\mathscr{H}_{1}+\mathscr{H}_{i}
$$

Define the dipole moment for $n$ atoms or molecules as: $\mu_{1}=-\sum_{i=1}^{n}\left(q_{e_{i}} \cdot d_{i}\right) \quad$ (C•m)
So that the Hamiltonian is:

$$
\mathscr{H}=\sum_{\mathrm{i}=1}^{\mathrm{n}}\left[\frac{1}{2} \cdot\left(\mathrm{p}_{\mathrm{i}} \cdot \mathrm{q}_{\mathrm{i}} \mathrm{i}\right)\right]-\sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}\left(\mathrm{q}_{\mathrm{i}}\right)\right)+\mu_{\mathbf{1}} \cdot \mathbf{E}_{\left.\mathbf{T}^{(\mathrm{q}}, \mathrm{t}\right)}
$$

the resulting electric potential energy is $\mathrm{q}_{\mathrm{e}} \cdot \mathrm{V}\left(\mathrm{q}_{1}, \mathrm{q}_{2}, . ., \mathrm{q}_{\mathrm{n}}\right)=\sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{q}_{\mathrm{e}} \cdot \mathrm{V}\left(\mathrm{q}_{\mathrm{i}}\right)\right)$
that is:

$$
\mathscr{H}=\frac{1}{2} \cdot \sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{p}_{\mathrm{i}} \cdot \mathrm{q}_{\mathrm{i}}\right)-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}\left(\mathrm{q}_{1}, \mathrm{q}_{2}, . ., \mathrm{q}_{\mathrm{n}}\right)+\mu_{\mathbf{1}} \cdot \mathbf{E}_{\mathbf{T}}(\mathrm{q}, \mathrm{t})
$$

## Quadrupole approximation of the vector potential

I Rewrite the Taylor series of the vector potential but now I trunk the series to the first order term:

$$
\mathbf{A}(\mathbf{q}, \mathrm{t})=\mathbf{A}(\mathbf{r}+\mathbf{R}, \mathrm{t})=\left[\mathbf{A}(\mathbf{R}, \mathrm{t})+\sum_{\mathrm{k}=1}^{\infty}\left[\frac{1}{\mathrm{k}!} \cdot(\mathbf{r} \cdot \nabla) \cdot \mathbf{A}\right]^{\mathrm{k}}\right] \approx[\mathbf{A}(\mathbf{R}, \mathrm{t})+(\mathbf{r} \cdot \nabla) \cdot \mathbf{A}(\mathrm{r}, \mathrm{t})]
$$

$[\mathbf{A}]=\frac{\mathrm{Wb}}{\mathrm{m}}$

$$
\text { namely: } \quad \mathbf{A}(\mathbf{q}, \mathrm{t})=\mathbf{A}(\mathbf{r}+\mathbf{R}, \mathrm{t}) \approx[\mathbf{A}(\mathbf{r}, \mathrm{t})+(\mathbf{r} \cdot \nabla) \cdot \mathbf{A}(\mathbf{r}, \mathrm{t})]
$$

then I substitute it in the equation of the electric field 3) namely:

$$
\begin{gather*}
\mathbf{E ( r , t ) = - \nabla \varphi ( r , t ) - \frac { \partial } { \partial \mathrm { t } } \mathbf { A } ( \mathrm { r } , \mathrm { t } )} \\
\mathbf{E}(\mathbf{r}, \mathrm{t})=-\nabla[\varphi(\mathbf{r}, \mathrm{t})+\mathbf{v} \cdot[\mathbf{A}(\mathbf{r}, \mathrm{t})+(\mathbf{r} \cdot \nabla) \cdot \mathbf{A}(\mathrm{r}, \mathrm{t})]]=-\nabla(\mathrm{U}) \\
\Phi_{1}(\mathbf{r}, \mathrm{t})=\varphi(\mathbf{r}, \mathrm{t})+\mathbf{v} \cdot[\mathbf{A}(\mathbf{r}, \mathrm{t})+(\mathbf{r} \cdot \nabla) \cdot \mathbf{A}(\mathbf{r}, \mathrm{t})]
\end{gather*}
$$

$$
\text { Scalar potential } \quad \varphi(\mathbf{r}, \mathrm{t})+\mathbf{v} \cdot[\mathbf{A}(\mathbf{r}, \mathrm{t})+(\mathbf{r} \cdot \nabla) \cdot \mathbf{A}(\mathbf{r}, \mathrm{t})]
$$

potential energy $\quad \mathrm{U}(\mathbf{r}, \mathrm{t})=-\mathrm{q}_{\mathrm{e}} \cdot \Phi_{1}=-\mathrm{q}_{\mathrm{e}} \cdot \varphi(\mathbf{r}, \mathrm{t})+\mathbf{v} \cdot[\mathbf{A}(\mathbf{r}, \mathrm{t})+(\mathbf{r} \cdot \nabla) \cdot \mathbf{A}(\mathrm{r}, \mathrm{t})]$
The Lagrangian of $n$ particles is:

$$
\mathscr{L}=\frac{1}{2} \cdot \sum_{\mathrm{i}=1}^{\mathrm{n}}\left(\mathrm{p}_{\mathrm{i}} \cdot \mathrm{q}_{\mathrm{i}}\right)-\mathrm{U}
$$

( $q_{i}$ is the ith position and $q_{e}$ the electron charge)
The Lagrangian of the system I deal with is:

$$
\mathrm{V}(\mathrm{q})=\Phi(\mathrm{x}, \mathrm{y}, \mathrm{z}, \mathrm{t}) \quad \mathscr{L}\left(\mathrm{q}, \mathrm{q}^{\prime}, \mathrm{t}\right)=\frac{1}{2} \cdot \mathrm{p} \cdot \mathrm{q}^{\prime}+\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathrm{q})-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{q}^{\prime} \cdot[\mathbf{A}(\mathrm{r}, \mathrm{t})+(\mathrm{q} \cdot \nabla) \cdot \mathbf{A}(\mathrm{r}, \mathrm{t})] \quad \mathbf{q}=\mathbf{r}
$$

$$
\begin{align*}
& \mathbf{q} \cdot \nabla=\left(\mathrm{x} \cdot \mathbf{i}_{\mathbf{x}}+\mathrm{y} \cdot \mathbf{i}_{\mathbf{y}}+\mathrm{z} \cdot \mathbf{i}_{\mathbf{z}}\right) \cdot\left(\mathbf{i}_{\mathbf{x}} \cdot \frac{\partial}{\partial \mathrm{x}}+\mathbf{i}_{\mathbf{y}} \cdot \frac{\partial}{\partial \mathrm{y}}+\mathbf{i}_{\mathbf{z}} \cdot \frac{\partial}{\partial \mathrm{z}}\right)=\mathrm{x} \cdot \frac{\partial}{\partial \mathrm{x}}+\mathrm{y} \cdot \frac{\partial}{\partial \mathrm{y}}+\mathrm{z} \cdot \frac{\partial}{\partial \mathrm{z}} \\
& (q \cdot \nabla) \cdot \mathbf{A}=\left(x \cdot \frac{\partial}{\partial \mathrm{x}}+\mathrm{y} \cdot \frac{\partial}{\partial \mathrm{y}}+\mathrm{z} \cdot \frac{\partial}{\partial \mathrm{z}}\right) \cdot \mathbf{A} \\
& \left(x \cdot \frac{\partial}{\partial x}+y \cdot \frac{\partial}{\partial y}+z \cdot \frac{\partial}{\partial z}\right) \cdot \mathbf{A}=\left(x \cdot \frac{\partial}{\partial x} A_{x}+y \cdot \frac{\partial}{\partial y} A_{x}+z \cdot \frac{\partial}{\partial z} A_{x}\right) \cdot i_{x} \cdots \\
& +\left(x \cdot \frac{\partial}{\partial x} A_{y}+y \cdot \frac{\partial}{\partial y} A_{y}+z \cdot \frac{\partial}{\partial z} A_{y}\right) \cdot \mathbf{i}_{y} \ldots \\
& +\left(x \cdot \frac{\partial}{\partial x} A_{z}+y \cdot \frac{\partial}{\partial y} A_{z}+z \cdot \frac{\partial}{\partial z} A_{z}\right) \cdot i_{z}
\end{align*}
$$

## Quadrupole Hamiltonian

$$
\mathscr{H}=\frac{1}{2} \cdot \mathrm{p} \cdot \mathrm{q}^{\prime}-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathrm{q})-\mu \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{r}, \mathrm{t})-\mathbf{M} \cdot \mathbf{B}+\frac{1}{2} \cdot \mathrm{q}_{\mathrm{e}} \cdot \mathbf{q} \cdot(\mathbf{q} \cdot \nabla) \cdot \mathbf{E}+\frac{\mathrm{q}_{\mathrm{e}}{ }^{2}}{8 \cdot \mathrm{~m}_{\mathrm{e}}} \cdot(\mathbf{q} \times \mathbf{B})^{2}
$$

Magnetic Dipole moment $\quad \mathbf{M}=\frac{-\mathrm{q}_{\mathrm{e}}}{2 \cdot \mathrm{~m}_{\mathrm{e}}} \cdot \mathbf{q} \times \mathbf{B} \quad$ due to the magnetic interaction.

$$
\text { Conjugated moment } \quad \mathbf{p}=\mathrm{m}_{\mathrm{e}} \cdot \mathbf{q}^{\prime}+\mathrm{q}_{\mathrm{e}} \cdot(\mathbf{q} \times \mathbf{B})
$$

Quadrupole term $\quad \frac{1}{2} \cdot q_{\mathrm{e}} \cdot \mathbf{q} \cdot(\mathbf{q} \cdot \nabla) \cdot \mathbf{E}$
Diamagnetic interaction (quadratic) $\frac{\mathrm{q}_{\mathrm{e}}{ }^{2}}{8 \cdot \mathrm{~m}_{\mathrm{e}}} \cdot(\mathbf{q} \times \mathbf{B})^{2}$
The term $-\mu \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})-\mathbf{M} \cdot \mathbf{B}$, considering the maximum values, I find: $\left|\mu \cdot \mathbf{E}_{\mathbf{T}}\right|=\mathrm{q}_{\mathrm{e}} \cdot|\mathbf{q}| \cdot\left|\mathbf{E}_{\mathbf{T}}\right|$,

$$
|\mathbf{M} \cdot \mathbf{B}|=\frac{\mathrm{q}_{\mathrm{e}}}{2 \cdot \mathrm{~m}} \cdot|\mathbf{r}| \cdot \mathrm{m} \cdot\left|\mathbf{r}^{\prime}\right| \cdot|\mathbf{B}|=\frac{\mathrm{q}_{\mathrm{e}}}{2} \cdot|\mathbf{r}| \cdot\left|\mathbf{r}^{\prime}\right| \cdot|\mathbf{B}|
$$

Furthermore $\frac{|\mathbf{M} \cdot \mathbf{B}|}{\left|\mu \cdot \mathbf{E}_{\mathbf{T}}\right|}=\frac{\left(\frac{\mathrm{q}_{\mathrm{e}}}{2} \cdot|\mathbf{q}| \cdot\left|\mathbf{q}^{\prime}\right| \cdot|\mathbf{B}|\right)}{\left(\mathrm{q}_{\mathrm{e}} \cdot|\mathbf{q}| \cdot\left|\mathbf{E}_{\mathbf{T}}\right|\right)}=\frac{\left|\mathbf{q}^{\prime}\right|}{2} \cdot \frac{|\mathbf{B}|}{\left|\mathbf{E}_{\mathbf{T}}\right|}=\frac{\left|\mathbf{q}^{\prime}\right|}{2} \cdot \frac{\eta}{\mathrm{c}}$, but $\left|\mathbf{q}^{\prime}\right| \ll\left(\frac{\mathrm{c}}{\eta}\right) \Rightarrow\left[\left(\frac{\eta \cdot\left|\mathbf{q}^{\prime}\right|}{\mathrm{c}}\right) \ll 1\right]$,
so that:

$$
|\mathbf{M} \cdot \mathbf{B}| \ll\left|\mu \cdot \mathbf{E}_{\mathbf{T}}\right|
$$

Finally I can write the classical Hamiltonian:

$$
\mathscr{H} \approx\left(\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathbf{q})-\mu \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})\right)
$$

51) 

namely, for $\left|\mathbf{q}^{\prime}\right| \ll\left(\frac{\mathrm{c}}{\eta}\right)$ is acceptable the dipole approximation without taking into account of the magnetism. I look for the corresponding quantum-mechanical Hamiltonian.

## QM Hamiltonian operator

Given the classical Hamiltonian $\mathscr{H}=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{V}(\mathbf{q})-\mu \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})$
and the following QM (quantum mechanical) correspondence rules:

| Rules |  |
| :---: | :---: |

how I get the quantized Hamiltonian? I substitute to each classical operator the one given by the table of the correspondences (at first only the energy E).
Classical mechanical energy $\mathrm{E}=\mathrm{T}+\mathrm{U}=\mathscr{H}$. In $\mathrm{QM}, \mathrm{E}$ and H are operators acting on a ket: $\mathbf{E}|\Psi>=\mathbf{H}| \Psi ン$ Namely, applying the previous substitutions rules, I get (vectorial operators are written with bold fonts):

$$
\begin{array}{ccc}
\text { Classical Hamiltonian } & \leftrightarrow & \text { QM Hamiltonian } \\
\mathscr{\mathscr { H }}=\frac{1}{2} \cdot \mathbf{p} \cdot \mathbf{q}^{\prime}-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathbf{q})-\boldsymbol{\mu} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t}) & \leftrightarrow & \mathbf{H}=\frac{-\hbar^{2}}{2 \cdot \mathrm{~m}} \cdot \Delta-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathbf{q})-\boldsymbol{\mu} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})
\end{array}
$$

where $\boldsymbol{\mu}$ is the unknown QM linear operator corresponding to the vector dipole moment.

$$
\text { Resulting Hamiltonian operator: } \mathbf{H}=\frac{-\hbar^{2}}{2 \cdot \mathrm{~m}} \cdot \Delta-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathbf{q})-\boldsymbol{\mu} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})
$$

Hamiltonian for macroscopic systems and small interactions close to equilibrium.
I distinguish three partial Hamiltonian:

$$
\mathbf{H}=\mathbf{H}_{\mathbf{0}}+\mathbf{H}_{\mathbf{i n t}}+\mathbf{H}_{\mathbf{r}}
$$

Unperturbed Hamiltonian $\mathbf{H}_{\mathbf{0}}$
Interaction Hamiltonian $\quad \mathbf{H}_{\mathbf{i n t}}$
Relaxation Hamiltonian $\quad \mathbf{H}_{\mathbf{r}}$

$$
\begin{array}{ll}
\text { Unperturbed Hamiltonian } & \mathbf{H}_{\mathbf{0}}=\frac{-\hbar^{2}}{2 \cdot \mathrm{~m}} \cdot \Delta \\
\text { Interaction Hamiltonian } & \mathbf{H}_{\mathbf{i n t}}=\boldsymbol{\mu} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t}) \\
\text { Relaxation Hamiltonian } & \mathbf{H}_{\mathbf{r}}=\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathbf{q})
\end{array}
$$

Finally after a substitution in eq $\mathrm{j} \cdot \hbar \cdot \frac{\partial}{\partial \mathrm{t}}|\Psi>=\mathbf{H}| \Psi>$, I obtain the Schrödinger equation of motion:

$$
\mathrm{j} \cdot \hbar \cdot \frac{\partial}{\partial \mathrm{t}}\left|\Psi_{\mathrm{k}}>=\left(\frac{-\hbar^{2}}{2 \cdot \mathrm{~m}} \cdot \Delta-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathbf{q})-\boldsymbol{\mu} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})\right)\right| \Psi_{\mathrm{k}}>
$$

If the system is in a stationary state of energy $E_{k}=\hbar \cdot \omega_{k}$, with $\left|\Psi_{k}(\mathbf{q}, \mathrm{t})>=\mathrm{e}^{\frac{-\mathrm{j}}{\hbar} \cdot \mathrm{E}_{\mathrm{k}} \cdot \mathrm{t}}\right| \psi_{\mathrm{k}}(\mathbf{q})>$, substituting in the previous equation, I get:

$$
\left.j \cdot \hbar \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{e}^{\frac{-\mathrm{j}}{\hbar \cdot \mathrm{E}_{\mathrm{k}} \cdot \mathrm{t}}} \mathrm{I} \psi_{\mathrm{k}}(\mathbf{q})>=\left(\frac{-\hbar^{2}}{2 \cdot \mathrm{~m}} \cdot \Delta-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathbf{q})-\boldsymbol{\mu} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})\right) \mathrm{e}^{\frac{-\mathrm{j}}{\hbar} \cdot \mathrm{E}_{\mathrm{k}} \cdot \mathrm{t}} \right\rvert\, \psi_{\mathrm{k}}(\mathbf{q})>
$$

On the left side, only the exponential is a function of time, so that the derivative become:

$$
\left.\frac{\partial}{\partial t} \mathrm{e}^{\frac{-\mathrm{j}}{\hbar} \cdot \mathrm{E}_{\mathrm{k}} \cdot \mathrm{t}}\left|\psi_{\mathrm{k}}>=\frac{\partial}{\partial \mathrm{t}} \mathrm{e}^{\frac{-\mathrm{j}}{\hbar} \cdot \mathrm{E}_{\mathrm{k}} \cdot \mathrm{t}}\right| \psi_{\mathrm{k}}>=-\frac{\mathrm{E}_{\mathrm{k}} \cdot \mathrm{e}^{-\frac{\mathrm{E}_{\mathrm{k}} \cdot \mathrm{t} \cdot \mathrm{j}}{\hbar}} \cdot \mathrm{j}}{\hbar} \right\rvert\, \psi_{\mathrm{k}}>
$$

which substituted into the equation gives

$$
-\mathrm{j} \cdot \hbar \cdot \frac{\mathrm{E}_{\mathrm{k}} \cdot \mathrm{e}^{-\frac{\mathrm{E}_{\mathrm{k}} \cdot \mathrm{t} \cdot \mathrm{j}}{\hbar}} \cdot \mathrm{j}}{\hbar}\left|\psi_{\mathrm{k}}>=\mathbf{H} \mathrm{e}^{\frac{-\mathrm{j}}{\hbar} \cdot \mathrm{E}_{\mathrm{k}} \cdot \mathrm{t}}\right| \psi_{\mathrm{k}}>
$$

resulting, after a simplification, the following time independent eigenvalue equation:

$$
\mathbf{H}\left|\psi_{\mathrm{k}}(\mathbf{q})>=\mathrm{E}_{\mathrm{k}}\right| \psi_{\mathrm{k}}(\mathbf{q})>
$$

where $E_{k}$ is the eigenvalue corresponding to the eigenket $\mid \psi_{k}(\mathbf{q})>$. The set of all eigenvalues constitutes the discrete spectrum of the operator $\mathbf{H}$. The time independent Schrödinger equation now is:

$$
\left(\frac{-\hbar^{2}}{2 \cdot \mathrm{~m}} \cdot \Delta-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{~V}(\mathbf{q})-\boldsymbol{\mu} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})\right)\left|\psi_{\mathrm{k}}(\mathbf{q})>=\mathrm{E}_{\mathrm{k}}\right| \psi_{\mathrm{k}}(\mathbf{q})>
$$

expanding the left side, results $\frac{-\hbar^{2}}{2 \cdot \mathrm{~m}} \cdot \Delta\left|\psi_{\mathrm{k}}>-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{V}(\mathbf{q})\right| \psi_{\mathrm{k}}>-\boldsymbol{\mu} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})\left|\psi_{\mathrm{k}}>=\mathrm{E}\right| \psi_{\mathrm{k}}>$
Consider the unperturbed Hamiltonian (in absence of $\mathrm{V}(\mathbf{q})$ and $\mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})$ ):

$$
\left.\mathbf{H}_{\mathbf{0}}\left|\psi_{\mathrm{k}}>=\frac{-\hbar^{2}}{2 \cdot \mathrm{~m}} \cdot \Delta\right| \psi_{\mathrm{k}}>=\mathrm{E}_{\mathrm{k}} \right\rvert\, \psi_{\mathrm{k}}>
$$

$$
\text { The Schrödinger equation is: } \frac{-\hbar^{2}}{2 \cdot \mathrm{~m}} \cdot \Delta\left|\psi_{\mathrm{k}}>=\mathrm{E}_{\mathrm{k}}\right| \psi_{\mathrm{k}}>
$$

四-Solution of the one-dimensional Schrödinger equation
Impose the condition that the unperturbed Hamiltonian be symmetrical, (or also inversion invariant) that is:

$$
\mathbf{H}_{\mathbf{0}}(\mathrm{p}, \mathrm{q})=\mathbf{H}_{\mathbf{0}}(\mathrm{p},-\mathrm{q}) \text { symmetry condition }
$$

As a result I can write: $\quad \mathbf{H}_{\mathbf{0}}(\mathrm{p}, \mathrm{q})\left|\psi_{\mathrm{k}}(\mathrm{q})>=\mathrm{E}_{\mathrm{k}}\right| \psi_{\mathrm{k}}(\mathrm{q})>$

$$
\text { and also } \quad \mathbf{H}_{\mathbf{0}}(\mathrm{p},-\mathrm{q})\left|\psi_{\mathrm{k}}(-\mathrm{q})>=\mathrm{E}_{\mathrm{k}}\right| \psi_{\mathrm{k}}(-\mathrm{q})>
$$

and for the hypotheses made $\quad \mathbf{H}_{\mathbf{0}}(\mathrm{p}, \mathrm{q})\left|\psi_{\mathrm{k}}(-\mathrm{q})>=\mathrm{E}_{\mathrm{k}}\right| \psi_{\mathrm{k}}(-\mathrm{q})>$
that is possible only if the kets $\mid \psi_{\mathrm{k}}(\mathrm{q})>$ and $\mid \psi_{\mathrm{k}}(-\mathrm{q})>$ are eigenfunctions of the same operator corresponding t the same non-degenerated eigenvalue $\mathrm{E}_{\mathrm{k}}$. And therefore the eigenkets $\| \psi_{\mathrm{k}}(\mathrm{q})>$ and $\| \psi_{\mathrm{k}}(-\mathrm{q})>$ are multiple one of the other. Namely $\left|\psi_{\mathrm{k}}(-\mathrm{q})>=\mathrm{c}_{0}\right| \psi_{\mathrm{k}}(\mathrm{q})>$ where $\mathrm{c}_{0}$ is a complex constant. As a consequence of that, I have:
$\mathbf{H}_{\mathbf{0}}(\mathrm{p}, \mathrm{q})\left|\psi_{\mathrm{k}}(\mathrm{q})>=\mathbf{H}_{\mathbf{0}}(\mathrm{p}, \mathrm{q})\right| \psi_{\mathrm{k}}[-(-\mathrm{q})]>=\mathbf{H}_{\mathbf{0}}(\mathrm{p}, \mathrm{q}) \cdot \mathrm{c}_{0}\left|\psi_{\mathrm{k}}(-\mathrm{q})>=\mathbf{H}_{\mathbf{0}}(\mathrm{p}, \mathrm{q}) \cdot \mathrm{c}_{0}{ }^{2}\right| \psi_{\mathrm{k}}(\mathrm{q})>$
so that $\mathrm{c}_{0}{ }^{2}= \pm 1 \Rightarrow\left|\psi_{\mathrm{k}}(-\mathrm{q})>= \pm\right| \psi_{\mathrm{k}}(\mathrm{q})>$ therefore the eigenkets are all even (Even functions: $\psi(\mathrm{t})=\psi(-\mathrm{t})$
or all odd (Odd functions: $\psi(\mathbf{t})=-\psi(-\mathbf{t})$ ). Namely the eigenkets form $\boldsymbol{a}$ finite disparity.
What are the consequences of the finite disparity on the interaction Hamiltonian?
Let me consider, therefore, the Interaction Hamiltonian: $\mathbf{H}_{\mathbf{i n t}}=-\boldsymbol{\mu} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})$, valid for a single dipole .
For a multitude of dipoles present in the lattice of a crystal, I must address the problem statistically. To do that, I nee the matrix elements built with the eigenfunctions of the unperturbed symmetrical Hamiltonian and forming a finite disparity:

$$
\mathbf{H 1}_{\mathbf{i n t}_{i, j}}=\left(-<\psi_{\mathrm{i}}\left|\boldsymbol{\mu} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})\right| \psi_{\mathrm{j}}>\right) \approx\left(-<\psi_{\mathrm{i}}|\boldsymbol{\mu}| \psi_{\mathrm{j}}>\mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})\right)=-\mu_{\mathrm{i}, \mathrm{j}} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})
$$

where the matrix element is:

$$
\mu_{\mathrm{i}, \mathrm{j}}=<\psi_{\mathrm{i}}|\mu| \psi_{\mathrm{j}}>=<\psi_{\mathrm{i}}\left|\sum_{\mathrm{k}}\left(-\mathrm{q}_{\mathrm{e}} \cdot \mathrm{q}_{\mathrm{k}}\right)\right| \psi_{\mathrm{j}}>=-\mathrm{q}_{\mathrm{e}} \cdot \sum_{\mathrm{k}}<\psi_{\mathrm{i}}\left|\mathrm{q}_{\mathrm{k}}\right| \psi_{\mathrm{j}}>
$$

( $\mathrm{q}_{\mathrm{k}}$ is the Lagrangian coordinate while $\mathrm{q}_{\mathrm{e}}$ is the electron charge)

$$
\begin{gather*}
\text { explicitly: } \left.\mu_{\mathrm{i}, \mathrm{j}}=-\mathrm{q}_{\mathrm{e}} \cdot \sum_{\mathrm{k}}\left(<\psi_{\mathrm{i}}\left|\mathrm{q}_{\mathrm{k}}\right| \psi_{\mathrm{j}}\right\rangle\right)=-\mathrm{q}_{\mathrm{e}} \cdot \sum_{\mathrm{k}} \int \overline{\psi_{\mathrm{i}}} \cdot \psi_{\mathrm{j}} \cdot \mathrm{q}_{\mathrm{k}} \mathrm{dq}_{\mathrm{k}} \\
\text { namely: } \mu_{\mathrm{i}, \mathrm{j}}=-\mathrm{q}_{\mathrm{e}} \cdot \sum_{\mathrm{k}} \int \overline{\psi_{\mathrm{i}}} \cdot \psi_{\mathrm{j}} \cdot \mathrm{q}_{\mathrm{k}} \mathrm{dq}_{\mathrm{k}}
\end{gather*}
$$

I distinguish two cases:
a) If the eigenkets of the unperturbed Hamiltonian, $\mathbf{H}_{\mathbf{0}}$, are all even (or all odd), it follows that both $\mid \psi_{\mathrm{i}}>$ and $\mid \psi_{\mathrm{j}}$ are all even, (or all odd), then the product $\overline{\psi_{i}} \cdot \psi_{\mathrm{j}}$ is odd and the integral is null, it follows that also $\mu_{\mathrm{i}, \mathrm{j}}=0$.
b) If an eigenket is even and the other is odd, then the integrals of the product $\overline{\psi_{i}} \cdot \psi_{j}$, are different from zero, and therefore also the corresponding dipolar moment $\mu_{\mathrm{i}, \mathrm{j}} \neq 0$. It follows that the elements $\mu_{\mathrm{i}, \mathrm{i}}$ of the main diagonal the matrix, are all zero if the unperturbed Hamiltonian $\underline{\mathbf{H}}_{\mathbf{0}}$ is invariant by inversion or symmetrical. It follows tha using the statistical operator $\boldsymbol{\rho}$, the statistical average of the component $\alpha$ of the dipole moment operator is:

$$
\begin{aligned}
& <\boldsymbol{\mu}_{\boldsymbol{\alpha}}>=\operatorname{Tr}\left(\boldsymbol{\rho} \cdot \boldsymbol{\mu}_{\boldsymbol{\alpha}}\right)=\operatorname{Tr}\left[\left(\begin{array}{ll}
\rho_{1,1} & \rho_{1,2} \\
\rho_{2,1} & \rho_{2,2}
\end{array}\right) \cdot\left(\begin{array}{cc}
0 & \mu_{\boldsymbol{\alpha}} \\
\overline{\mu_{\alpha}} & 0
\end{array}\right)\right]=\operatorname{Tr}\left[\left(\begin{array}{l}
\overline{\mu_{\alpha}} \cdot \rho_{1,2} \\
\overline{\mu_{\alpha}} \cdot \rho_{2,2}
\end{array} \mu_{\boldsymbol{\alpha}} \cdot \rho_{1,1}, \rho_{2,1}\right)\right]=\overline{\mu_{\alpha}} \cdot \rho_{1,2}+\mu_{\alpha} \cdot \rho_{2,1} \\
& \alpha=x, y, z \\
& <\mu_{\mathbf{X}}>=\overline{\mu_{\mathrm{x}}} \cdot \rho_{1,2}+\mu_{\mathrm{x}} \cdot \rho_{2,1} \\
& <\mu_{\mathbf{y}}>=\overline{\mu_{\mathrm{y}}} \cdot \rho_{1,2}+\mu_{\mathrm{y}} \cdot \rho_{2,1} \\
& <\mu_{\mathbf{Z}}>=\overline{\mu_{\mathrm{Z}}} \cdot \rho_{1,2}+\mu_{\mathrm{Z}} \cdot \rho_{2,1}
\end{aligned}
$$

And will be null also the elements of the main diagonal of the interaction Hamiltonian operator $\mathbf{H 1}_{\mathbf{i n t}}^{\mathrm{i}, \mathrm{i}}$ in matrix form, whose generic element is given by:

$$
\mathbf{H 1}_{\mathbf{i n t}_{\mathrm{i}, \mathrm{j}}}=-\mu_{\mathrm{i}, \mathrm{j}} \cdot \mathbf{E}_{\mathbf{T}} .
$$

so I can write $\mathbf{H}_{\mathbf{0}}=\left(\begin{array}{cc}E_{1} & 0 \\ 0 & E_{2}\end{array}\right) \quad \boldsymbol{\mu}_{\boldsymbol{\alpha}}=\left(\begin{array}{cc}0 & \mu_{\alpha} \\ \mu_{\alpha} & 0\end{array}\right) \quad \alpha=x, y, z$

$$
\mu_{\mathbf{x}}=\left(\begin{array}{cc}
0 & \mu_{\mathrm{x}} \\
\overline{\mu_{\mathrm{x}}} & 0
\end{array}\right) \quad \mu_{\mathbf{y}}=\left(\begin{array}{cc}
0 & \mu_{\mathrm{y}} \\
\overline{\mu_{\mathrm{y}}} & 0
\end{array}\right) \quad \mu_{\mathbf{z}}=\left(\begin{array}{cc}
0 & \mu_{\mathrm{z}} \\
\overline{\mu_{\mathrm{z}}} & 0
\end{array}\right)
$$

Furthermore it results that $\boldsymbol{\mu}_{\boldsymbol{\alpha}}=\boldsymbol{\mu}_{\boldsymbol{\alpha}}{ }^{\dagger} \quad$ Hermitian matrix $\quad \alpha=\mathrm{x}, \mathrm{y}, \mathrm{z}$

$$
\text { in fact: } \left.\quad \boldsymbol{\mu}_{\boldsymbol{\alpha}}{ }^{\dagger}=\left(\overline{\boldsymbol{\mu}_{\boldsymbol{\alpha}}}\right)^{\mathrm{T}}=\left[\begin{array}{cc}
0 & \mu_{\alpha} \\
\overline{\mu_{\alpha}} & 0
\end{array}\right)\right]^{\mathrm{T}}=\left(\begin{array}{cc}
0 & \overline{\mu_{\alpha}} \\
\overline{\overline{\mu_{\alpha}}} & 0
\end{array}\right)^{\mathrm{T}}=\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
\overline{\mu_{\alpha}} & 0
\end{array}\right)=\mu_{\boldsymbol{\alpha}}
$$

the interaction Hamiltonian operator in matrix form is:
explicitly:

$$
\mathbf{H} 1_{\mathbf{i n t}}=-\boldsymbol{\mu} \cdot \mathbf{E}_{\mathbf{T}}(\mathbf{q}, \mathrm{t})=-\sum_{\alpha}\left(\mu_{\alpha} \cdot \mathrm{E}_{\alpha}\right)=\sum_{\alpha}\left(\begin{array}{cc}
0 & -\mu_{\alpha} \cdot \mathrm{E}_{\alpha} \\
-\bar{\mu}_{\alpha} \cdot \mathrm{E}_{\alpha} & 0
\end{array}\right)
$$

Now I look for the time evolution of the expectation value of the discrete operator dipole moment's $\alpha$ component.
The differential equation that let me study the time evolution of the expectation value of an operator, is the one knor from

QM (eq. (18.1)), that for the vectorial operator dipole moment's $\alpha$ component is:

$$
\frac{\mathrm{d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>-<\frac{\mathrm{d}}{\mathrm{dt}} \mu_{\boldsymbol{\alpha}}>=\frac{1}{\mathrm{j} \cdot \hbar} \cdot\left(<\left[\mu_{\mathbf{\alpha}}, \mathbf{H}\right]>\right)
$$

Assuming that the dipole moment decrease exponentially with transversal time constant (or damping constant) $\mathrm{T}_{2}$回Check the accuracy
the differential equation become: $\frac{d}{d t}<\mu_{\boldsymbol{\alpha}}>+\frac{<\mu_{\boldsymbol{\alpha}}>}{T_{2}}=\frac{1}{j \cdot \hbar} \cdot\left(<\left[\mu_{\boldsymbol{\alpha}}, \mathbf{H}\right]>\right)$
The Hamiltonian appearing in the commutator of eq 77), is formed by the sum of the unperturbed Hamiltonian and tt interaction one:

$$
\begin{gather*}
\mathbf{H}=\mathbf{H}_{\mathbf{0}}+\mathbf{H 1} \mathbf{i n t}=\left(\begin{array}{cc}
\mathrm{E}_{1} & 0 \\
0 & \mathrm{E}_{2}
\end{array}\right)+\left(\begin{array}{cc}
0 & -\mu_{\alpha} \cdot \mathrm{E}_{\alpha} \\
-\overline{\mu_{\alpha}} \cdot \mathrm{E}_{\alpha} & 0
\end{array}\right)=\left(\begin{array}{cc}
\mathrm{E}_{1} & -\mu_{\alpha} \cdot \mathrm{E}_{\alpha} \\
-\bar{\mu}_{\alpha} \cdot \mathrm{E}_{\alpha} & \mathrm{E}_{2}
\end{array}\right) \\
\text { namely: } \mathbf{H}=\left(\begin{array}{cc}
\mathrm{E}_{1} & -\mu_{\alpha} \cdot \mathrm{E}_{\alpha} \\
-\mu_{\alpha} \cdot \mathrm{E}_{\alpha} & \mathrm{E}_{2}
\end{array}\right)
\end{gather*}
$$

Now I can calculate the commutator between the dipole moment's $\alpha$ component operator, and the Hamiltonian preser the right side of 77):

$$
\begin{gathered}
{\left[\mu_{\mathbf{\alpha}}, \mathbf{H}\right]=\mu_{\mathbf{\alpha}} \cdot \mathbf{H}-\mathbf{H} \cdot \mu_{\mathbf{\alpha}}=\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
\mu_{\alpha} & 0
\end{array}\right) \cdot\left(\begin{array}{cc}
\mathrm{E}_{1} & -\mu_{\alpha} \cdot E_{\alpha} \\
-\mu_{\alpha} \cdot E_{\alpha} & E_{2}
\end{array}\right)-\left(\begin{array}{cc}
E_{1} & -\mu_{\alpha} \cdot E_{\alpha} \\
-\mu_{\alpha} \cdot E_{\alpha} & E_{2}
\end{array}\right) \cdot\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
\mu_{\alpha} & 0
\end{array}\right)} \\
\mu_{\alpha}:=\mu_{\alpha} \quad E_{1}:=E_{1} \quad E_{2}:=E_{2} \quad E_{\alpha}:=E_{\alpha} \\
\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
\mu_{\alpha} & 0
\end{array}\right) \cdot\left(\begin{array}{cc}
E_{1} & -\mu_{\alpha} \cdot E_{\alpha} \\
-\mu_{\alpha} \cdot E_{\alpha} & E_{2}
\end{array}\right)-\left(\begin{array}{cc}
E_{1} & -\mu_{\alpha} \cdot E_{\alpha} \\
-\overline{\mu_{\alpha}} \cdot E_{\alpha} & E_{2}
\end{array}\right) \cdot\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
\overline{\mu_{\alpha}} & 0
\end{array}\right) \rightarrow\left(\begin{array}{cc}
0 & E_{2} \cdot \mu_{\alpha}-E_{1} \cdot \mu_{\alpha} \\
E_{1} \cdot \overline{\mu_{\alpha}}-E_{2} \cdot \mu_{\alpha} & 0
\end{array}\right) \\
\text { that is: }\left[\mu_{\mathbf{\alpha}}, \mathbf{H}\right]=\left[\begin{array}{cc}
0 & \mu_{\alpha} \cdot\left(E_{2}-E_{1}\right) \\
-\overline{\mu_{\alpha}} \cdot\left(E_{2}-E_{1}\right) & 0
\end{array}\right]
\end{gathered}
$$

I know that $\left(E_{2}-E_{1}\right)=\omega_{0} \cdot \hbar$ substituting in the previous result, I obtain that the commutator is:

$$
\left[\mu_{\boldsymbol{\alpha}}, \mathbf{H}\right]=\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
-\overline{\mu_{\alpha}} & 0
\end{array}\right) \cdot\left(E_{2}-E_{1}\right)=\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
-\overline{\mu_{\alpha}} & 0
\end{array}\right) \cdot \omega_{0} \cdot \hbar
$$

so that, finally, the commutator results to be $\left[\boldsymbol{\mu}_{\boldsymbol{\alpha}}, \mathbf{H}\right]=\left(\begin{array}{cc}0 & \mu_{\alpha} \\ -\overline{\mu_{\alpha}} & 0\end{array}\right) \cdot \omega_{0} \cdot \hbar=\mu_{\boldsymbol{\alpha}} \cdot \omega_{0} \cdot \hbar$

$$
\text { that is }\left[\mu_{\boldsymbol{\alpha}}, \mathbf{H}\right]=\mu_{\boldsymbol{\alpha}} \cdot \omega_{0} \cdot \hbar
$$

furthermore it is anti-Hermitian, in fact:

$$
\left[\mu_{\mathbf{\alpha}}, \mathbf{H}\right]=-\left(\left[\mu_{\alpha}, \mathbf{H}\right]\right)^{\dagger} \quad \mu_{\alpha}=\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
\overline{\mu_{\alpha}} & 0
\end{array}\right)
$$

Now I substitute 79) in the differential equation of the motion of the average value of the dipole moment's $\alpha$ compon operator 77):

$$
\text { obtaining: } \frac{\mathrm{d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>+\frac{<\mu_{\boldsymbol{\alpha}}>}{\mathrm{T}_{2}}=\frac{\omega_{0}}{j}<\mu_{\boldsymbol{\alpha}}>
$$

It is a simple first order differential equation and, collecting $\left\langle\mu_{\boldsymbol{\alpha}}\right\rangle$, it simplify to:

## ■

$$
\frac{\mathrm{d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>=-\left(\frac{1}{\mathrm{~T}_{2}}-\frac{\omega_{0}}{\mathrm{j}}\right)<\mu_{\boldsymbol{\alpha}}>
$$

■
as was expected.
But, deriving once both sides of 81), with respect to the time, I get

$$
\frac{\mathrm{d}^{2}}{\mathrm{dt}^{2}}<\mu_{\alpha}>+\frac{1}{\mathrm{~T}_{2}} \cdot \frac{\mathrm{~d}}{\mathrm{dt}}<\mu_{\alpha}>=\frac{\omega_{0}}{\mathrm{j}} \frac{\mathrm{~d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>
$$

Let me consider again the equation 76)

$$
\frac{\mathrm{d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>-<\frac{\mathrm{d}}{\mathrm{dt}} \mu_{\boldsymbol{\alpha}}>=\frac{1}{\mathrm{j} \cdot \hbar} \cdot\left(<\left[\mu_{\boldsymbol{\alpha}}, \mathbf{H}\right]>\right)
$$

the left side is composed by two terms:

1) the average of the time derivative of the operator:

$$
\text { a) }<\frac{\mathrm{d}}{\mathrm{dt}} \boldsymbol{\mu}_{\boldsymbol{\alpha}}>=-\frac{<\mu_{\boldsymbol{\alpha}}>}{\mathrm{T}_{2}}
$$

2) the time derivative of the average of the operator:

$$
\begin{array}{r}
\frac{\mathrm{d}}{\mathrm{dt}}<\mathbf{A}>=\frac{1}{\mathrm{j} \cdot \hbar} \cdot(<[\mathbf{A}, \mathbf{H}]>)+<\frac{\mathrm{d}}{\mathrm{dt}} \mathbf{A}> \\
\text { b) } \quad \frac{\mathrm{d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>=\frac{1}{\mathrm{j} \cdot \hbar} \cdot\left(<\left[\mu_{\boldsymbol{\alpha}}, \mathbf{H}\right]>\right)-\frac{1}{\mathrm{~T}_{2}} \cdot\left(<\mu_{\boldsymbol{\alpha}}>\right)
\end{array}
$$

Substituting those results at the right side of eq. 82) I get:

$$
\frac{\mathrm{d}^{2}}{\mathrm{dt}^{2}}<\mu_{\boldsymbol{\alpha}}>+\frac{1}{\mathrm{~T}_{2}} \cdot \frac{\mathrm{~d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>=\frac{\omega_{0}}{\mathrm{j}}\left[\frac{1}{\mathrm{j} \cdot \hbar} \cdot\left(<\left[\boldsymbol{\mu}_{\boldsymbol{\alpha}}, \mathbf{H}\right]>\right)-\frac{1}{\mathrm{~T}_{2}} \cdot\left(<\mu_{\boldsymbol{\alpha}}>\right)\right]
$$

the average: $<\mu_{\boldsymbol{\alpha}}>$ on the right side of 83) can be obtained from eq. 81):

$$
<\mu_{\alpha}>=\frac{j}{\omega_{0}} \cdot\left(\frac{\mathrm{~d}}{\mathrm{dt}}<\mu_{\alpha}>+\frac{<\mu_{\boldsymbol{\alpha}}>}{\mathrm{T}_{2}}\right)
$$

substituting into eq. 83), I have:

$$
\frac{\mathrm{d}^{2}}{\mathrm{dt}^{2}}<\mu_{\boldsymbol{\alpha}}>+\frac{1}{T_{2}} \cdot \frac{\mathrm{~d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>=\frac{\omega_{0}}{\mathrm{j}}\left[\begin{array}{l}
\frac{1}{\mathrm{j} \cdot \hbar} \cdot\left(<\left[\mu_{\boldsymbol{\alpha}}, \mathbf{H}\right]>\right) \ldots \\
+\frac{-1}{T_{2}} \cdot \frac{\mathrm{j}}{\omega_{0}} \cdot\left(\frac{\mathrm{~d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>+\frac{<\mu_{\boldsymbol{\alpha}}>}{T_{2}}\right)
\end{array}\right]
$$

Calculation of the expectation value of the commutator: $<\left[\mu_{\boldsymbol{\alpha}}, \mathbf{H}\right]>\quad \alpha=\mathrm{x}, \mathrm{y}, \mathrm{z}$

$$
\text { knowing that the Hamiltonian is } \mathbf{H}=\left(\begin{array}{cc}
\mathrm{E}_{1} & -\mu_{\alpha} \cdot \mathrm{E}_{\alpha} \\
-\overline{\mu_{\alpha}} \cdot \mathrm{E}_{\alpha} & \mathrm{E}_{2}
\end{array}\right)
$$

substituting into the commutator I get:

$$
\left[\mu_{\boldsymbol{\alpha}}, \mathbf{H}\right]=\left[\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
-\overline{\mu_{\alpha}} & 0
\end{array}\right),\left(\begin{array}{cc}
\mathrm{E}_{1} & -\mu_{\alpha} \cdot \mathrm{E}_{\alpha} \\
-\overline{\mu_{\alpha}} \cdot \mathrm{E}_{\alpha} & \mathrm{E}_{2}
\end{array}\right)\right]
$$

calculating the commutator results:

$$
\begin{aligned}
{\left[\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
-\overline{\mu_{\alpha}} & 0
\end{array}\right),\left(\begin{array}{cc}
E_{1} & -\mu_{\alpha} \cdot E_{\alpha} \\
-\overline{\mu_{\alpha}} \cdot \mathrm{E}_{\alpha} & \mathrm{E}_{2}
\end{array}\right)\right]=} & \left(\begin{array}{cc}
0 & \mu_{\alpha} \\
-\overline{\mu_{\alpha}} & 0
\end{array}\right) \cdot\left(\begin{array}{cc}
\mathrm{E}_{1} & -\mu_{\alpha} \cdot \mathrm{E}_{\alpha} \\
-\overline{\mu_{\alpha}} \cdot \mathrm{E}_{\alpha} & \mathrm{E}_{2}
\end{array}\right) \cdots \\
& +(-1) \cdot\left(\begin{array}{cc}
\mathrm{E}_{1} & -\mu_{\alpha} \cdot \mathrm{E}_{\alpha} \\
-\overline{\mu_{\alpha}} \cdot \mathrm{E}_{\alpha} & \mathrm{E}_{2}
\end{array}\right) \cdot\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
-\overline{\mu_{\alpha}} & 0
\end{array}\right)
\end{aligned}
$$

But if I calculate the expectation value of this commutator , I obtain a result different from eq 79) $\omega_{0} \cdot \hbar \cdot\left(<\mu_{\boldsymbol{\alpha}}\right.$ : fact I have to consider the difference between averages which is the average of the difference:

$$
\begin{aligned}
& E_{1}:=E_{1} \quad E_{\alpha}:=E_{\alpha} \quad E_{2}:=E_{2} \quad \mu_{\alpha}:=\mu_{\alpha} \\
& <\left[\mu_{\boldsymbol{\alpha}}, \mathbf{H}\right]>=<\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
-\overline{\mu_{\alpha}} & 0
\end{array}\right) \cdot\left(\begin{array}{cc}
E_{1} & -\mu_{\alpha} \cdot E_{\alpha} \\
-\overline{\mu_{\alpha}} \cdot E_{\alpha} & E_{2}
\end{array}\right)>-<\left(\begin{array}{cc}
E_{1} & -\mu_{\alpha} \cdot E_{\alpha} \\
-\overline{\mu_{\alpha}} \cdot E_{\alpha} & E_{2}
\end{array}\right) \cdot\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
-\overline{\mu_{\alpha}} & 0
\end{array}\right)>
\end{aligned}
$$

After a simplification

$$
\begin{aligned}
& \left(\begin{array}{cc}
0 & \mu_{\alpha} \\
-\overline{\mu_{\alpha}} & 0
\end{array}\right) \cdot\left(\begin{array}{cc}
\mathrm{E}_{1} & -\mu_{\alpha} \cdot \mathrm{E}_{\alpha} \\
-\overline{\mu_{\alpha}} \cdot \mathrm{E}_{\alpha} & \mathrm{E}_{2}
\end{array}\right) \rightarrow\left(\begin{array}{cc}
-\mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} & \mathrm{E}_{2} \cdot \mu_{\alpha} \\
-\mathrm{E}_{1} \cdot \overline{\mu_{\alpha}} & \mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}}
\end{array}\right) \\
& \left(\begin{array}{cc}
\mathrm{E}_{1} & -\mu_{\alpha} \cdot \mathrm{E}_{\alpha} \\
-\overline{\mu_{\alpha}} \cdot \mathrm{E}_{\alpha} & \mathrm{E}_{2}
\end{array}\right) \cdot\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
-\overline{\mu_{\alpha}} & 0
\end{array}\right) \rightarrow\left(\begin{array}{cc}
\mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} & \mathrm{E}_{1} \cdot \mu_{\alpha} \\
-\mathrm{E}_{2} \cdot \overline{\mu_{\alpha}} & -\mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}}
\end{array}\right)
\end{aligned}
$$

results:

$$
\begin{gathered}
<\left[\mu_{\boldsymbol{\alpha}}, \mathbf{H}\right]>=<\left(\begin{array}{cc}
-\mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} & \mathrm{E}_{2} \cdot \mu_{\alpha} \\
-\mathrm{E}_{1} \cdot \overline{\mu_{\alpha}} & \mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}}
\end{array}\right)>-<\left(\begin{array}{cc}
\mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} & \mathrm{E}_{1} \cdot \mu_{\alpha} \\
-\mathrm{E}_{2} \cdot \overline{\mu_{\alpha}} & -\mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}}
\end{array}\right)> \\
<\mathbf{A}>-<\mathbf{B}>=<(\mathbf{A}-\mathbf{B})>
\end{gathered}
$$

$\left(\begin{array}{cc}-\mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} & \mathrm{E}_{2} \cdot \mu_{\alpha} \\ -\mathrm{E}_{1} \cdot \overline{\mu_{\alpha}} & \mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}}\end{array}\right)-\left[\begin{array}{cc}\mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} & \mathrm{E}_{1} \cdot \mu_{\alpha} \\ -\mathrm{E}_{2} \cdot \overline{\mu_{\alpha}} & -\left(\mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}}\right)\end{array}\right]$ simplify $\rightarrow\left[\begin{array}{cc}-2 \cdot \mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} & -\mu_{\alpha} \cdot\left(\mathrm{E}_{1}-\mathrm{E}_{2}\right) \\ -\overline{\mu_{\alpha}} \cdot\left(\mathrm{E}_{1}-\mathrm{E}_{2}\right) & 2 \cdot \mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}}\end{array}\right]$ the expectation value of the commutator is:

$$
\begin{gathered}
<\left[\mu_{\mathbf{\alpha}}, \mathbf{H}\right]>=<\left[\begin{array}{cc}
-2 \cdot \mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} & -\mu_{\alpha} \cdot\left(\mathrm{E}_{1}-\mathrm{E}_{2}\right) \\
-\overline{\mu_{\alpha}} \cdot\left(\mathrm{E}_{1}-\mathrm{E}_{2}\right) & 2 \cdot \mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}}
\end{array}\right]> \\
\text { knowing that } \mathrm{E}_{2}-\mathrm{E}_{1}=\omega_{0} \cdot \hbar
\end{gathered}
$$

Furthermore I can write the expectation value in a simplified form, as follows:

$$
<\left[\begin{array}{cc}
-2 \cdot \mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} & -\mu_{\alpha} \cdot\left(\mathrm{E}_{1}-\mathrm{E}_{2}\right) \\
-\overline{\mu_{\alpha}} \cdot\left(\mathrm{E}_{1}-\mathrm{E}_{2}\right) & 2 \cdot \mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}}
\end{array}\right]>=-2 \cdot \mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} \cdot\left[<\left(\begin{array}{cc}
1 & 0 \\
0 & -1
\end{array}\right)>\right]+\omega_{0} \cdot \hbar \cdot\left[<\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
\overline{\mu_{\alpha}} & 0
\end{array}\right)>\right]
$$

First I calculate the expectation value of the Pauli matrix $\sigma_{3}=\left(\begin{array}{cc}1 & 0 \\ 0 & -1\end{array}\right)$

$$
\begin{aligned}
<\sigma_{3}>=<\left(\begin{array}{cc}
1 & 0 \\
0 & -1
\end{array}\right)>=\operatorname{Tr}\left[\rho \cdot\left(\begin{array}{cc}
1 & 0 \\
0 & -1
\end{array}\right)\right] & =\operatorname{Tr}\left[\left(\begin{array}{cc}
\rho_{1,1} & \rho_{1,2} \\
\rho_{2,1} & \rho_{2,2}
\end{array}\right) \cdot\left(\begin{array}{cc}
1 & 0 \\
0 & -1
\end{array}\right)\right]=\operatorname{Tr}\left(\left(\begin{array}{ll}
\rho_{1,1} & -\rho_{1,2} \\
\rho_{2,1} & -\rho_{2,2}
\end{array}\right)\right)=\rho_{1,1}-\rho_{2,2} \\
& <\left(\begin{array}{cc}
0 & \mu_{\alpha} \\
\mu_{\alpha} & 0
\end{array}\right)>=<\mu_{\alpha}>
\end{aligned}
$$

$$
\text { finally resulting: } \quad<\left[\mu_{\boldsymbol{\alpha}}, \mathbf{H}\right]>=-2 \cdot \mathrm{E}_{\boldsymbol{\alpha}} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)+\omega_{0} \cdot \hbar \cdot\left(<\mu_{\mathbf{\alpha}}>\right)
$$

substituting in eq.:84) I get:

$$
\frac{\mathrm{d}^{2}}{\mathrm{dt}^{2}}<\mu_{\boldsymbol{\alpha}}>+\frac{1}{\mathrm{~T}_{2}} \cdot \frac{\mathrm{~d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>=\frac{\omega_{0}}{j}\left[\begin{array}{l}
\frac{1}{j \cdot \hbar} \cdot\left[-2 \cdot \mathrm{E}_{\boldsymbol{\alpha}} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)+\omega_{0} \cdot \hbar \cdot\left(<\mu_{\boldsymbol{\alpha}}>\right)\right] \ldots \\
+\frac{-1}{\mathrm{~T}_{2}} \cdot \frac{\mathrm{j}}{\omega_{0}} \cdot\left(\frac{\mathrm{~d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>+\frac{<\mu_{\boldsymbol{\alpha}}>}{\mathrm{T}_{2}}\right)
\end{array}\right]
$$

and after a simplification of the right side, I get:
$\frac{\mathrm{d}^{2}}{\mathrm{dt}^{2}}<\mu_{\boldsymbol{\alpha}}>+\frac{1}{\mathrm{~T}_{2}} \cdot \frac{\mathrm{~d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>=\frac{2 \cdot \mathrm{E}_{\boldsymbol{\alpha}} \cdot \mu_{\boldsymbol{\alpha}} \cdot \overline{\mu_{\alpha}} \cdot \omega_{0} \cdot\left(\rho_{\left.1,1-\rho_{2,2}\right)}\right.}{\hbar}-\omega_{0}^{2} \cdot\left(<\mu_{\boldsymbol{\alpha}}>\right)-\frac{\frac{\mathrm{d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>}{\mathrm{T}_{2}}-\frac{<\mu_{\boldsymbol{\alpha}}>}{\mathrm{T}_{2}{ }^{2}}$
collecting the derivatives at the left side and leaving the constant term at the right side, I find:

$$
\frac{\mathrm{d}^{2}}{\mathrm{dt}^{2}}<\mu_{\boldsymbol{\alpha}}>+\frac{2}{\mathrm{~T}_{2}} \cdot \frac{\mathrm{~d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>+\left(\omega_{0}^{2}+\frac{1}{\mathrm{~T}_{2}^{2}}\right) \cdot\left(<\mu_{\boldsymbol{\alpha}}>\right)=\frac{2 \cdot \mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} \cdot \omega_{0} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)}{\hbar}
$$

This equation, formally, is like to the equation of a classical harmonic oscillator forced by the electric field $\mathrm{E}_{\alpha}$. QSolving the equation

This equation can be rewritten as a function of the density operator $\boldsymbol{\rho}$, placing:

$$
\rho_{1,1}-\rho_{2,2}=<\left(\begin{array}{cc}
1 & 0 \\
0 & -1
\end{array}\right)>=<\mathbf{D}>
$$

Let me consider again the equation of the motion of an operator average $\mathbf{A}$ :

$$
\frac{\mathrm{d}}{\mathrm{dt}}<\mathbf{A}>-<\frac{\partial}{\partial \mathrm{t}} \mathbf{A}>=\frac{1}{\mathrm{j} \cdot \hbar} \cdot(<[\mathbf{A}, \mathbf{H}]>)
$$

rewritten for the new operator $\mathbf{D}: \frac{\mathrm{d}}{\mathrm{dt}}<\mathbf{D}>-<\frac{\partial}{\partial \mathrm{t}} \mathbf{D}>=\frac{1}{\mathrm{j} \cdot \hbar} \cdot(<[\mathbf{D}, \mathbf{H}]>)$

$$
\text { place the average derivative }<\frac{\partial}{\partial \mathrm{t}} \mathbf{D}>=-\frac{<\mathbf{D}>-(<\mathbf{D}>)^{\mathrm{e}}}{\mathrm{~T}_{1}}
$$

substituting 88 ) and 90 ) into 87 ), results:

$$
\begin{align*}
& \qquad \frac{\mathrm{d}}{\mathrm{dt}}<\mathbf{D}>+\frac{<\mathbf{D}>-(<\mathbf{D}>)^{\mathrm{e}}}{\mathrm{~T}_{1}}=\frac{1}{\mathrm{j} \cdot \hbar} \cdot(<[\mathbf{D}, \mathbf{H}]>) \\
& \text { The Hamiltonian be: } \mathbf{H}=\left(\begin{array}{cc}
\mathrm{E}_{1} & -\mu_{\alpha} \cdot \mathrm{E}_{\alpha} \\
-\overline{\mu_{\alpha}} \cdot \mathrm{E}_{\alpha} & \mathrm{E}_{2}
\end{array}\right)
\end{align*}
$$

it let me calculate the commutator on the right side of 91):
$[\mathbf{D}, \mathbf{H}]=\left(\begin{array}{cc}1 & 0 \\ 0 & -1\end{array}\right) \cdot\left(\begin{array}{cc}\mathrm{E}_{1} & -\mu_{\alpha} \cdot \mathrm{E}_{\alpha} \\ -\overline{\mu_{\alpha}} \cdot \mathrm{E}_{\alpha} & \mathrm{E}_{2}\end{array}\right)-\left(\begin{array}{cc}\mathrm{E}_{1} & -\mu_{\alpha} \cdot E_{\alpha} \\ -\overline{\mu_{\alpha}} \cdot \mathrm{E}_{\alpha} & \mathrm{E}_{2}\end{array}\right) \cdot\left(\begin{array}{cc}1 & 0 \\ 0 & -1\end{array}\right)=\left(\begin{array}{cc}0 & -2 \cdot E_{\alpha} \cdot \mu_{\alpha} \\ 2 \cdot \mathrm{E}_{\alpha} \cdot \overline{\mu_{\alpha}} & 0\end{array}\right)$
resulting: $[\mathbf{D}, \mathbf{H}]=-2 \cdot E_{\alpha} \cdot\left(\begin{array}{cc}0 & \mu_{\alpha} \\ -\overline{\mu_{\alpha}} & 0\end{array}\right)=-2 \cdot E_{\alpha} \cdot \mu_{\boldsymbol{\alpha}}$
remember that $\mu_{\boldsymbol{\alpha}}=\mu_{\boldsymbol{\alpha}}^{\dagger} \quad$ Hermitian matrix
finally the average is $<[\mathbf{D}, \mathbf{H}]>=-2 \cdot \mathrm{E}_{\alpha} \cdot\left(<\mu_{\boldsymbol{\alpha}}>\right)$ been $<\left(\begin{array}{cc}0 & \mu_{\alpha} \\ -\overline{\mu_{\alpha}} & 0\end{array}\right)>=<\mu_{\boldsymbol{\alpha}}>$

$$
\begin{gathered}
\text { from which I have } \frac{1}{\mathrm{j} \cdot \hbar}<\mu_{\boldsymbol{\alpha}}>=\frac{1}{\omega_{0} \cdot \hbar} \cdot\left(\frac{\mathrm{~d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>+\frac{<\mu_{\mathbf{\alpha}}>}{\mathrm{T}_{2}}\right) \\
\omega_{0}=\frac{\mathrm{E}_{2}-\mathrm{E}_{1}}{\hbar}
\end{gathered}
$$

After a substitution in eq. 89), I find that:

$$
\begin{align*}
& \frac{\mathrm{d}}{\mathrm{dt}}<\mathbf{D}>+\frac{<\mathbf{D}>-(<\mathbf{D}>)^{\mathrm{e}}}{\mathrm{~T}_{1}}=\frac{-2 \cdot \mathrm{E}_{\alpha}}{\mathrm{j} \cdot \hbar} \cdot\left(<\mu_{\boldsymbol{\alpha}}>\right)=\frac{-2 \cdot \mathrm{E}_{\alpha}}{\omega_{0} \cdot \hbar} \cdot\left(\frac{\mathrm{~d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>+\frac{<\mu_{\alpha}>}{\mathrm{T}_{2}}\right) \\
& \text { that is: } \frac{\mathrm{d}}{\mathrm{dt}}<\mathbf{D}>_{+} \frac{<\mathbf{D}>-(<\mathbf{D}>)^{\mathrm{e}}}{\mathrm{~T}_{1}}=\frac{-2 \cdot \mathrm{E}_{\alpha}}{\omega_{0} \cdot \hbar} \cdot\left(\frac{\mathrm{~d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>+\frac{<\mu_{\boldsymbol{\alpha}}>}{\mathrm{T}_{2}}\right)
\end{align*}
$$

Equilibrium density operator: $(<\mathbf{D}>)^{\mathrm{e}}=\left(\rho_{1,1}-\rho_{2,2}\right) \mathrm{e}$

$$
<\mathbf{D}>=\rho_{1,1}-\rho_{2,2}
$$

substituting in eq. 90 ), it assumes the form:

$$
\frac{d}{d t}\left(\rho_{1,1}-\rho_{2,2}\right)+\frac{\rho_{1,1}-\rho_{2,2}-\left(\rho_{1,1}-\rho_{2,2}\right)}{T_{1}}=\frac{-2 \cdot E_{\boldsymbol{\alpha}}}{\hbar \cdot \omega_{0}} \cdot\left[\frac{d}{d t}<\mu_{\boldsymbol{\alpha}}>+\frac{1}{T_{2}} \cdot\left(<\mu_{\boldsymbol{\alpha}}>\right)\right]
$$

Now, I will describe the time evolution of the polarization per unit of crystal volume $\left(\mathrm{M}_{\mathrm{ar}}\right.$ states for arithmetic average) where are present $\mathrm{N}_{\mathrm{p}}$ dipoles.

The polarization is:

$$
\begin{array}{r}
\mathbf{P}_{\boldsymbol{\alpha}}=\frac{\sum_{i=1}^{N_{p}}\left(<\mu_{\boldsymbol{\alpha}}>\right)_{i}}{\mathrm{~V}}=\frac{\mathrm{N}_{\mathrm{p}}}{\mathrm{~V}} \cdot \frac{\sum_{i=1}^{\mathrm{N}_{\mathrm{p}}}\left(<\mu_{\boldsymbol{\alpha}}>\right)_{\mathrm{i}}}{\mathrm{~N}_{\mathrm{p}}}=\mathrm{N}_{\mathrm{V}} \cdot \mathrm{M}_{\mathrm{ar}}\left(<\mu_{\boldsymbol{\alpha}}>\right) \\
\mathbf{P}_{\boldsymbol{\alpha}}=\mathrm{N}_{\mathrm{V}} \cdot \mathrm{M}_{\mathrm{ar}}\left(<\mu_{\boldsymbol{\alpha}}>\right) \quad \mathrm{m}^{-3} \cdot \mathrm{C} \cdot \mathrm{~m}=\frac{\mathrm{C}}{\mathrm{~m}^{2}}
\end{array}
$$

Spatial dipolar moment average value $_{\mathrm{M}_{\mathrm{ar}}}\left(<\mu_{\boldsymbol{\alpha}}>\right)=\frac{\sum_{\mathrm{i=1}}^{\mathrm{N}_{\mathrm{p}}}\left(<\mu_{\boldsymbol{\alpha}}>\right)_{\mathrm{i}}}{\mathrm{N}}$
Active centers (or polarized molecules) density: $\mathrm{N}_{\mathrm{V}}=\frac{\mathrm{N}_{\mathrm{p}}}{\mathrm{V}}$.
Now I will try to modify eq. 87) at the light of the previous definition (94), 95), 96)). I rewrite eq. 87):

$$
\frac{\mathrm{d}^{2}}{\mathrm{dt}^{2}}<\mu_{\boldsymbol{\alpha}}>+\frac{2}{\mathrm{~T}_{2}} \cdot \frac{\mathrm{~d}}{\mathrm{dt}}<\mu_{\boldsymbol{\alpha}}>+\left(<\mu_{\boldsymbol{\alpha}}>\right) \cdot\left(\omega_{0}^{2}+\frac{1}{\mathrm{~T}_{2}^{2}}\right)=\frac{-2 \cdot \omega_{0} \cdot \mathrm{E}_{\alpha} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)}{\hbar}
$$

Multiply both sides of eq. 87) by $\mathrm{N}_{\mathrm{V}}$ :

$$
\begin{align*}
& \frac{\mathrm{d}^{2}}{\mathrm{dt}^{2}}\left[\mathrm{~N}_{\mathrm{V}} \cdot\left(<\mu_{\boldsymbol{\alpha}}>\right)\right]+\frac{2}{\mathrm{~T}_{2}} \cdot \frac{\mathrm{~d}}{\mathrm{dt}}\left[\mathrm{~N}_{\mathrm{V}} \cdot\left(<\mu_{\boldsymbol{\alpha}}>\right)\right] \ldots=\frac{-2 \cdot \mathrm{~N}_{\mathrm{V}} \cdot \omega_{0} \cdot \mathrm{E}_{\boldsymbol{\alpha}} \cdot \mu_{\alpha} \cdot \overline{\mu_{\alpha}} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)}{\hbar} \\
& +\mathrm{N}_{\mathrm{V}} \cdot\left(<\mu_{\boldsymbol{\alpha}}>\right) \cdot\left(\omega_{0}^{2}+\frac{1}{\mathrm{~T}_{2}^{2}}\right)
\end{align*}
$$

then I calculate a spatial average of both sides:
as previously defined $\frac{\sum_{i=1}^{N_{p}}\left(<\mu_{\alpha}>\right)_{i}}{N}=M_{a r}\left(<\mu_{\alpha}>\right) \quad$ which substituted into the equation gives

$$
\begin{aligned}
& \frac{\partial^{2}}{\partial \mathrm{t}^{2}}\left(\mathrm{~N}_{\mathrm{V}} \cdot \mathrm{M}_{\mathrm{ar}}\left(<\mu_{\boldsymbol{\alpha}}>\right)\right)+\frac{2}{\mathrm{~T}_{2}} \cdot \frac{\partial}{\partial \mathrm{t}}\left(\mathrm{~N}_{\mathrm{V}} \cdot \mathrm{M}_{\mathrm{ar}}\left(<\mu_{\boldsymbol{\alpha}}>\right)\right) \ldots=\frac{-2 \cdot \mathrm{~N}_{\mathrm{V}} \cdot \omega_{0} \cdot \mathrm{E}_{\alpha} \cdot \mathrm{M}_{\mathrm{ar}}\left[\mu_{\alpha} \cdot \mu_{\alpha} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)\right]}{\hbar} \\
& +\mathrm{N}_{\mathrm{V}} \cdot \mathrm{M}_{\mathrm{ar}}\left(<\mu_{\boldsymbol{\alpha}}>\right) \cdot\left(\omega_{0}^{2}+\frac{1}{\mathrm{~T}_{2}^{2}}\right)
\end{aligned}
$$

The $\alpha$ component of the polarization is: $\mathrm{P}_{\alpha}=\mathrm{N}_{\mathrm{V}} \cdot \mathrm{M}_{\mathrm{ar}}\left(<\mu_{\alpha}>\right)$ So the equation assumes the simple form:

$$
\frac{\partial^{2}}{\partial \mathrm{t}^{2}} \mathrm{P}_{\alpha}+\frac{2}{\mathrm{~T}_{2}} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}+\mathrm{P}_{\alpha} \cdot\left(\omega_{0}^{2}+\frac{1}{\mathrm{~T}_{2}^{2}}\right)=\frac{-2 \cdot \mathrm{~N}_{\mathrm{V}} \cdot \omega_{0} \cdot \mathrm{E}_{\alpha} \cdot \mathrm{M}_{\mathrm{ar}}\left[\mu_{\alpha} \cdot \overline{\mu_{\alpha}} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)\right]}{\hbar}
$$

To a random distribution of the molecules corresponds a random distribution of the components $\mu_{\alpha}$ and $\overline{\mu_{\alpha}}$, resultin that $\mu_{\alpha} \cdot \overline{\mu_{\alpha}}$ and $\rho_{1,1}-\rho_{2,2}$ are uncorrelated, so that I can write:
spatial average value: $\mathrm{Mar}_{\operatorname{ar}}\left[\mu_{\alpha} \cdot \overline{\mu_{\alpha}} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)\right]=\mathrm{M}_{\mathrm{ar}}\left(\mu_{\alpha} \cdot \overline{\mu_{\alpha}}\right) \cdot \mathrm{M}_{\mathrm{ar}}\left(\rho_{1,1}-\rho_{2,2}\right)$
If, instead, the molecules have all the same orientation, then $\mu_{\alpha} \cdot \overline{\mu_{\alpha}}$ is statistically independent from $\rho_{1,1}-\rho_{2,2}$, finally resulting:

$$
\mathrm{Mar}_{\mathrm{ar}}\left[\mu_{\alpha} \cdot \overline{\mu_{\alpha}} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)\right]=\mu_{\alpha} \cdot \overline{\mu_{\alpha}} \cdot \mathrm{M}_{\mathrm{ar}}\left(\rho_{1,1}-\rho_{2,2}\right)
$$

Now I consider the case of a low correlation between $\mu_{\alpha} \cdot \overline{\mu_{\alpha}}$ and $\rho_{1,1}-\rho_{2,2}$ namely:
spatial average value: $\mathrm{Mar}_{\operatorname{ar}}\left[\mu_{\alpha} \cdot \overline{\mu_{\alpha}} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)\right]=\mathrm{M}_{\operatorname{ar}}\left(\mu_{\alpha} \cdot \overline{\mu_{\alpha}}\right) \cdot \mathrm{M}_{\operatorname{ar}}\left(\rho_{1,1}-\rho_{2,2}\right)$.
Than I can write:

$$
\mathrm{M}_{\mathrm{ar}}\left[\mathrm{~N}_{\mathrm{V}} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)\right]=\mathrm{M}_{\mathrm{ar}}\left(\mathrm{~N}_{\mathrm{V}} \cdot \rho_{1,1}\right)-\mathrm{M}_{\mathrm{ar}}\left(\mathrm{~N}_{\mathrm{V}} \cdot \rho_{2,2}\right)=\mathrm{N}_{\mathrm{V}} \cdot\left(\mathrm{M}_{\mathrm{ar}}\left(\rho_{1,1}\right)-\mathrm{M}_{\mathrm{ar}}\left(\rho_{2,2}\right)\right)
$$

$N_{V}=\frac{N_{p}}{V} \quad M_{a r}\left[N_{V} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)\right]=\frac{N_{p}}{V} \cdot\left(M_{a r}\left(\rho_{1,1}\right)-M_{a r}\left(\rho_{2,2}\right)\right)=\frac{N_{p}}{V} \cdot\left[\frac{\sum_{j}\left(\rho_{1,1}\right)_{j}}{N_{p}}\right]-\frac{N_{p}}{V} \cdot\left[\frac{\sum_{j}\left(\rho_{2,2}\right)_{j}}{N_{p}}\right]$

$$
M_{\operatorname{ar}}\left[\mathrm{N}_{\mathrm{V}} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)\right]=\frac{\sum_{\mathrm{j}}\left(\rho_{1,1}\right)_{j}}{\mathrm{~V}}-\frac{\sum_{j}\left(\rho_{2,2}\right)_{j}}{\mathrm{~V}}=\mathrm{N}_{1}-\mathrm{N}_{2}
$$

The spatial average value is $\mathrm{Mar}_{\mathrm{ar}}\left[\mathrm{N}_{\mathrm{V}} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)\right]=\mathrm{N}_{1}-\mathrm{N}_{2}$
and the $\alpha$ component of the polarization is: $\left.\mathrm{P}_{\alpha}=\mathrm{N}_{\mathrm{V}} \cdot \mathrm{M}_{\mathrm{ar}}\left(<\mu_{\alpha}\right\rangle\right)=\mathrm{N}_{1}-\mathrm{N}_{2}$

$$
\sum_{i}\left(\rho_{1,1}\right)_{j}
$$

Molecular density at energetic level $1: \mathrm{N}_{1}=\frac{\mathrm{j}}{\mathrm{V}}$

$$
\text { Molecular density at energetic level 2: } N_{2}=\frac{\sum_{j}\left(\rho_{2,2}\right)_{j}}{V}
$$

Going back to equation 99) for the polarization operator, below rewritten:

$$
\frac{\partial^{2}}{\partial \mathrm{t}^{2}} \mathrm{P}_{\alpha}+\frac{2}{\mathrm{~T}_{2}} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}+\mathrm{P}_{\alpha} \cdot\left(\omega_{0}^{2}+\frac{1}{\mathrm{~T}_{2}^{2}}\right)=\frac{-2 \cdot \mathrm{~N}_{\mathrm{V}} \cdot \omega_{0} \cdot \mathrm{E}_{\alpha} \cdot \mathrm{M}_{\mathrm{ar}}\left[\mu_{\alpha} \cdot \overline{\mu_{\alpha}} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)\right]}{\hbar}
$$

and substituting 102), I obtain the macroscopic equations:
$N_{\mathrm{V}} \cdot \frac{\mathrm{d}}{\mathrm{dt}}\left(\mathrm{M}_{\mathrm{ar}}\left(\rho_{1,1}-\rho_{2,2}\right)\right) \ldots$
$=\frac{-2 \cdot \mathrm{E}_{\alpha} \cdot \mathrm{N}_{\mathrm{V}}}{\hbar \cdot \omega_{0}} \cdot\left(\frac{\partial}{\partial \mathrm{t}} \mathrm{M}_{\mathrm{ar}}\left(<\mu_{\boldsymbol{\alpha}}>\right)+\frac{1}{\mathrm{~T}_{2}} \cdot \mathrm{M}_{\mathrm{ar}}\left(<\mu_{\boldsymbol{\alpha}}>\right)\right)$
$+\frac{\mathrm{N}_{\mathrm{v}} \cdot \mathrm{M}_{\mathrm{ar}}\left(\rho_{.1,1}-\rho_{2,2}\right)-\mathrm{N}_{\mathrm{V}} \cdot \mathrm{M}_{\mathrm{ar}}\left[\left(\rho_{1,1}-\rho_{2,2}\right)_{\mathrm{e}}\right]}{\mathrm{T}_{1}}$

I define the average value of the transversal field acting on each molecule $\mathrm{E}_{\alpha l o c}=\mathrm{N}_{\mathrm{V}} \cdot \mathrm{E}_{\alpha}$, the density difference of dipoles is $N_{1}-N_{2}=N_{V} \cdot M_{a r}\left(\rho_{1,1}-\rho_{2,2}\right)$, while the thermal equilibrium density is $\left(N_{1}-N_{2}\right)_{e}=N_{V} \cdot M_{a r}\left[\left(\rho_{1,1}-\rho_{2,2}\right)_{e}\right]$.
The differential equation 99) simplify to:

$$
\begin{array}{r}
\frac{\frac{d}{d t}\left(N_{1}-N_{2}\right)+\frac{N_{1}-N_{2}-\left(N_{1}-N_{2}\right)_{e}}{T_{1}}=\frac{-2 \cdot \mathrm{E}_{\alpha \operatorname{loc}}}{\hbar \cdot \omega_{0}} \cdot\left(\frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}+\frac{1}{\mathrm{~T}_{2}} \cdot \mathrm{P}_{\alpha}\right)}{\text { Polarization } \mathrm{P}_{\alpha}=\mathrm{N}_{\mathrm{V}} \cdot \mathrm{M}_{\mathrm{ar}}\left(\left\langle\mu_{\alpha}\right\rangle\right)} \\
\left.\frac{\partial^{2}}{\partial \mathrm{t}^{2}} \mathrm{P}_{\alpha}+\frac{2}{\mathrm{~T}_{2}} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}+\mathrm{P}_{\alpha} \cdot\left(\omega_{0}^{2}+\frac{1}{\mathrm{~T}_{2}^{2}}\right)=\frac{-2 \cdot \mathrm{~N}_{\mathrm{V}} \cdot \omega_{0} \cdot \mathrm{E}_{\alpha} \cdot \mathrm{M}_{\mathrm{ar}}\left[\mu_{\alpha} \cdot \overline{\mu_{\alpha}} \cdot\left(\rho_{1,1}-\rho_{2,2}\right)\right]}{\hbar}\right]
\end{array}
$$

The effect of the time harmonic electromagnetic field on the dielectric material is finally described by the two equatic

$$
\begin{array}{r}
\frac{\partial^{2}}{\partial \mathrm{t}^{2}} \mathrm{P}_{\alpha}+\frac{2}{\mathrm{~T}_{2}} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}+\mathrm{P}_{\alpha} \cdot\left(\omega_{0}^{2}+\frac{1}{\mathrm{~T}_{2}^{2}}\right)=\frac{-2 \cdot \omega_{0} \cdot \mathrm{E}_{\alpha \operatorname{loc}} \cdot \mathrm{M}_{\mathrm{ar}}\left(\mu_{\alpha} \cdot \overline{\mu_{\alpha}}\right) \cdot\left(\mathrm{N}_{1}-\mathrm{N}_{2}\right)}{\hbar} \\
\frac{\mathrm{d}}{\mathrm{dt}}\left(\mathrm{~N}_{1}-\mathrm{N}_{2}\right)+\frac{\mathrm{N}_{1}-\mathrm{N}_{2}-\left(\mathrm{N}_{1}-\mathrm{N}_{2}\right)_{\mathrm{e}}}{\mathrm{~T}_{1}}=\frac{-2 \cdot \mathrm{E}_{\alpha \operatorname{loc}}}{\hbar \cdot \omega_{0}} \cdot\left(\frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}+\frac{1}{\mathrm{~T}_{2}} \cdot \mathrm{P}_{\alpha}\right)
\end{array}
$$

If results that $\left(\mathrm{T}_{2} \cdot \omega_{0}\right) \gg 1$ and $\left(\mathrm{T}_{1} \cdot \omega_{0}\right) \gg 1$ then $\omega_{0} \gg\left(\frac{1}{\mathrm{~T}_{2}}\right)$ and $\omega_{0} \gg\left(\frac{1}{\mathrm{~T}_{1}}\right)$ equation 104) simplify to:

$$
\left(\frac{\partial^{2}}{\partial \mathrm{t}^{2}} \mathrm{P}_{\alpha}+\frac{2}{\mathrm{~T}_{2}} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}+\mathrm{P}_{\alpha} \cdot \omega_{0}^{2}\right) \approx\left[\frac{-2 \cdot \omega_{0} \cdot \mathrm{E}_{\alpha \mathrm{loc}} \cdot \mathrm{M}_{\mathrm{ar}}\left(\mu_{\alpha} \cdot \overline{\mu_{\alpha}}\right) \cdot\left(\mathrm{N}_{1}-\mathrm{N}_{2}\right)}{\hbar}\right]
$$

Furthermore, considering a time dependence of $P_{\alpha}$ of the type $P_{\alpha}(t)=p_{\alpha} \cdot e^{j \cdot \omega_{0} \cdot t}$ and $\frac{\partial}{\partial t} P_{\alpha}=\omega_{0} \cdot p_{\alpha} \cdot e^{j \cdot \omega_{0} \cdot t} \cdot j$

$$
\begin{gathered}
\frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}(\mathrm{t})=\left(\omega_{0} \cdot \mathrm{p}_{\alpha} \cdot \mathrm{e}^{\mathrm{j} \cdot \omega_{0} \cdot \mathrm{t}} \cdot \mathrm{j}\right) \gg\left(\frac{1}{\mathrm{~T}_{2}} \cdot \mathrm{p}_{\alpha} \cdot \mathrm{e}^{\mathrm{j} \cdot \omega_{0} \cdot \mathrm{t}}\right) \\
\left(\omega_{0} \cdot \mathrm{p}_{\alpha}\right) \gg\left(\frac{1}{\mathrm{~T}_{2}} \cdot p_{\alpha}\right)
\end{gathered}
$$

Equation 105) become: $\left[\frac{\mathrm{d}}{\mathrm{dt}}\left(\mathrm{N}_{1}-\mathrm{N}_{2}\right)+\frac{\mathrm{N}_{1}-\mathrm{N}_{2}-\left(\mathrm{N}_{1}-\mathrm{N}_{2}\right)_{\mathrm{e}}}{\mathrm{T}_{1}}\right] \approx\left(\frac{-2 \cdot \mathrm{E}_{\alpha \mathrm{loc}}}{\hbar \cdot \omega_{0}} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}\right)$
Finally the system of equations is:

$$
\frac{\left(\frac{\partial^{2}}{\partial \mathrm{t}^{2}} \mathrm{P}_{\alpha}+\frac{2}{\mathrm{~T}_{2}} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}+\mathrm{P}_{\alpha} \cdot \omega_{0}^{2}\right) \approx\left[\frac{-2 \cdot \omega_{0} \cdot \mathrm{E}_{\alpha l o c} \cdot \mathrm{M}_{\mathrm{ar}}\left(\mu_{\alpha} \cdot \overline{\mu_{\alpha}}\right) \cdot\left(\mathrm{N}_{1}-\mathrm{N}_{2}\right)}{\hbar}\right]}{\left[\frac{\mathrm{d}}{\mathrm{dt}}\left(\mathrm{~N}_{1}-\mathrm{N}_{2}\right)+\frac{\left(\mathrm{N}_{1}-\mathrm{N}_{2}\right)-\left(\mathrm{N}_{1}-\mathrm{N}_{2}\right)}{\mathrm{e}}\right] \approx\left(\frac{-2 \cdot \mathrm{E}_{\alpha l o c}}{\hbar \cdot \omega_{0}} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}\right)}
$$

Assume isotropic materials only, then in equation 106), the average $\mathrm{Mar}_{\mathrm{ar}}\left(\mu_{\alpha} \cdot \overline{\mu_{\alpha}}\right)=\mathrm{M}_{\mathrm{ar}}\left[\left(\left|\mu_{\alpha}\right|\right)^{2}\right] \cdot \delta(\alpha, \alpha)$ (Kronecker $\delta$ ), moreover, as a further effect of the isotropy, there is the independence of the effects from the directic that is:

$$
\mathrm{Mar}_{\mathrm{ar}}\left[\left(\left|\mu_{\mathrm{\alpha}}\right|\right)^{2}\right]=\mathrm{M}_{\mathrm{ar}}\left[\left(\left|\mu_{\mathrm{x}}\right|\right)^{2}\right]=\mathrm{M}_{\mathrm{ar}}\left[\left(\left|\mu_{\mathrm{y}}\right|\right)^{2}\right]=\mathrm{M}_{\mathrm{ar}}\left[\left(\left|\mu_{\mathrm{z}}\right|\right)^{2}\right]
$$

Considering the transition from state 1 to state 2 ,

$$
\begin{align*}
& \mathrm{Mar}_{\mathrm{ar}}\left[\left(\left|\mu_{1,2}\right|\right)^{2}\right]=\mathrm{Mar}_{\mathrm{ar}}\left[\left(\left|\mu_{1}\right|\right)^{2}\right]+\mathrm{M}_{\mathrm{ar}}\left[\left(\left|\mu_{2}\right|\right)^{2}\right]+\mathrm{M}_{\mathrm{ar}}\left[\left(\left|\mu_{3}\right|\right)^{2}\right]=3 \cdot \mathrm{Mar}_{\mathrm{ar}}\left[\left(\left|\mu_{\alpha}\right|\right)^{2}\right] \\
& \mathrm{Mar}_{\mathrm{ar}}\left[\left(\left|\mu_{\alpha}\right|\right)^{2}\right]=\frac{\mathrm{M}_{\mathrm{ar}}\left[\left(\left|\mu_{1,2}\right|\right)^{2}\right]}{3}
\end{align*}
$$

substituting in eq. 106), I get:

$$
\frac{\partial^{2}}{\partial \mathrm{t}^{2}} \mathrm{P}_{\alpha}+\frac{2}{\mathrm{~T}_{2}} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}+\mathrm{P}_{\alpha} \cdot \omega_{0}^{2}=\frac{-2 \cdot \omega_{0} \cdot \mathrm{E}_{\alpha l o c} \cdot \mathrm{M}_{\mathrm{ar}}\left[\left(\left|\mu_{1,2}\right|\right)^{2}\right] \cdot\left(\mathrm{N}_{1}-\mathrm{N}_{2}\right)}{3 \cdot \hbar}
$$

The stored energy in a unitary volume is $W_{12}=\mathrm{N}_{1} \cdot \mathrm{E}_{1}+\mathrm{N}_{2} \cdot \mathrm{E}_{2}$
Adding and subtracting $N_{2} \cdot \frac{E_{1}}{2}$ and $N_{1} \cdot \frac{E_{2}}{2}$, in the last equation, I find an expression for the stored energy more ust

$$
W_{12}=N_{1} \cdot E_{1}+N_{2} \cdot E_{2}=\left(\frac{E_{1}+E_{2}}{2}\right) \cdot\left(N_{1}+N_{2}\right)+\left(\frac{E_{1}-E_{2}}{2}\right) \cdot\left(N_{1}-N_{2}\right)
$$

Calculations
keeping in mind tha $\mathrm{N}_{\mathrm{V}}=\mathrm{N}_{1}+\mathrm{N}_{2} \quad \omega_{0} \cdot \hbar=\mathrm{E}_{2}-\mathrm{E}_{1} \quad$ the energy $\mathrm{W}_{21}=\mathrm{N}_{1} \cdot \mathrm{E}_{1}+\mathrm{N}_{2} \cdot \mathrm{E}_{2}$ can be rewritten as:
$N_{1} \cdot E_{1}+N_{2} \cdot E_{2}=\left(\frac{E_{1}+E_{2}}{2}\right) \cdot\left(N_{1}+N_{2}\right)+\left(\frac{E_{1}-E_{2}}{2}\right) \cdot\left(N_{1}-N_{2}\right)=\left(\frac{E_{1}+E_{2}}{2}\right) \cdot N_{V}-\frac{\omega_{0} \cdot \hbar}{2} \cdot\left(N_{1}-N_{2}\right)$

$$
\begin{align*}
& \text { namely } \quad \mathrm{W}_{12}=\mathrm{N}_{1} \cdot \mathrm{E}_{1}+\mathrm{N}_{2} \cdot \mathrm{E}_{2}=\left(\frac{\mathrm{E}_{2}+\mathrm{E}_{1}}{2}\right) \cdot \mathrm{N}_{\mathrm{V}}-\frac{\omega_{0} \cdot \hbar}{2} \cdot\left(\mathrm{~N}_{1}-\mathrm{N}_{2}\right) \quad \frac{\mathrm{J}}{\mathrm{~m}^{3}} \\
& \frac{\partial}{\partial \mathrm{t}} \mathrm{~W}_{12}=-\frac{\omega_{0} \cdot \hbar}{2} \cdot \frac{\partial}{\partial \mathrm{t}}\left(\mathrm{~N}_{1}-\mathrm{N}_{2}\right)
\end{align*}
$$

I can substitute those results in eq. 107) to obtain a differential equation for the energy.
Consider equation 107) $\frac{d}{d t}\left(N_{1}-N_{2}\right)+\frac{\left(N_{1}-N_{2}\right)-\left(N_{1}-N_{2}\right)}{T_{1}}=\frac{-2 \cdot E_{\alpha l o c}}{\hbar \cdot \omega_{0}} \cdot \frac{\partial}{\partial t} P_{\alpha}$
multiply both sides by
$-\frac{\omega_{0} \cdot \hbar}{2}$

$$
\begin{gathered}
\frac{\frac{\mathrm{d}}{\mathrm{dt}}\left[-\frac{\omega_{0} \cdot \hbar}{2} \cdot\left(\mathrm{~N}_{1}-\mathrm{N}_{2}\right)\right]-\frac{\omega_{0} \cdot \hbar}{2} \cdot \frac{\left(\mathrm{~N}_{1}-\mathrm{N}_{2}\right)-\left(\mathrm{N}_{1}-\mathrm{N}_{2}\right)_{\mathrm{e}}}{\mathrm{~T}_{1}}=\mathrm{E}_{\alpha l o c} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}}{\text { the terms }-\frac{\omega_{0} \cdot \hbar}{2} \cdot\left(\mathrm{~N}_{1}-\mathrm{N}_{2}\right)=\mathrm{W}_{12}-\left(\frac{\mathrm{E}_{2}+\mathrm{E}_{1}}{2}\right) \cdot \mathrm{N}_{\mathrm{V}}} \\
\text { and } \frac{\omega_{0} \cdot \hbar}{2} \cdot\left(\mathrm{~N}_{1}-\mathrm{N}_{2}\right)_{\mathrm{e}}=-\mathrm{W}_{12}+\left(\frac{\mathrm{E}_{2}+\mathrm{E}_{1}}{2}\right) \cdot \mathrm{N}_{\mathrm{V}}
\end{gathered}
$$

substituting in eq 107") I get:

$$
\frac{d}{d t}\left[W_{12}-\left(\frac{E_{2}+E_{1}}{2}\right) \cdot N_{V}\right]+\frac{W_{12}-\left(\frac{E_{2}+E_{1}}{2}\right) \cdot N_{V}-W_{12}+\left(\frac{E_{2}+E_{1}}{2}\right) \cdot N_{V}}{T_{1}}=E_{\alpha l o c} \cdot \frac{\partial}{\partial t} P_{\alpha}
$$

and after a simplification result:
Energy balance equation $\frac{W}{\mathrm{~m}^{3}} \quad \frac{\mathrm{~d}}{\mathrm{dt}} \mathrm{W}_{12}+\frac{\mathrm{W}_{12}-\mathrm{W}_{12} \mathrm{e}^{2}}{\mathrm{~T}_{1}}=\mathrm{E}_{\alpha \mathrm{loc}} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha} \quad \frac{\mathrm{V}}{\mathrm{m}} \cdot \frac{\mathrm{C}}{\mathrm{m}^{2} \cdot \mathrm{~s}}=1 \cdot \frac{\mathrm{~W}}{\mathrm{~m}^{3}}$
$\mathrm{E}_{\alpha \mathrm{loc}} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}$ is the work per time unite and volume, made by the field on the medium (acting on the polarization), equating the average power density delivered to the medium. (one part of it is dissipated and the other is stored). Extract, now, from eq. 110) the difference $\mathrm{N}_{1}-\mathrm{N}_{2}$ that appears also in eq 109):

I rewrite eq. 110): $\mathrm{W}_{12}=\left(\frac{\mathrm{E}_{2}+\mathrm{E}_{1}}{2}\right) \cdot \mathrm{N}_{\mathrm{V}}-\frac{\omega_{0} \cdot \hbar}{2} \cdot\left(\mathrm{~N}_{1}-\mathrm{N}_{2}\right)$

$$
\text { resulting: } \mathrm{N}_{1}-\mathrm{N}_{2}=\frac{2}{\left(\omega_{0} \cdot \hbar\right)} \cdot\left[\left(\frac{\mathrm{E}_{2}+\mathrm{E}_{1}}{2}\right) \cdot \mathrm{N}_{\mathrm{V}}-\mathrm{W}_{12}\right]
$$

rewrite eq 109):

$$
\frac{\partial^{2}}{\partial \mathrm{t}^{2}} \mathrm{P}_{\alpha}+\frac{2}{\mathrm{~T}_{2}} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}+\mathrm{P}_{\alpha} \cdot \omega_{0}^{2}=\frac{-2 \cdot \omega_{0} \cdot \mathrm{E}_{\alpha l o c} \cdot \mathrm{M}_{\mathrm{ar}}\left[\left(\left|\mu_{1,2}\right|\right)^{2}\right] \cdot\left(\mathrm{N}_{1}-\mathrm{N}_{2}\right)}{3 \cdot \hbar}
$$

substituting 112) I get the system of differential equations for $\mathrm{P}_{\mathrm{\alpha}}$ and $\mathrm{W}_{12}$ :

$$
\frac{\frac{\partial^{2}}{\partial \mathrm{t}^{2}} \mathrm{P}_{\alpha}+\frac{2}{\mathrm{~T}_{2}} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\alpha}+\mathrm{P}_{\alpha} \cdot \omega_{0}{ }^{2}=\frac{-4 \cdot \mathrm{E}_{\alpha l o c} \cdot \mathrm{M}_{\mathrm{ar}}\left[\left(\left|\mu_{1,2}\right|\right)^{2}\right]}{3 \cdot \hbar^{2}} \cdot\left[\left(\frac{\mathrm{E}_{2}+\mathrm{E}_{1}}{2}\right) \cdot \mathrm{N}_{\mathrm{V}}-\mathrm{W}_{12}\right]}{\frac{\mathrm{d}}{\mathrm{dt}} \mathrm{~W}_{12}+\frac{\mathrm{W}_{12}-\mathrm{W}_{12} \mathrm{e}}{\mathrm{~T}_{1}}=\mathrm{E}_{\alpha l o c} \cdot \frac{\partial}{\partial \mathrm{t}} \mathrm{P}_{\mathrm{\alpha}}}
$$
