User and training guides and related documentation from PTC Inc. and its subsidiary companies (collectively "PTC") are subject to the copyright laws of the United States and other countries and are provided under a license agreement that restricts copying, disclosure, and use of such documentation. PTC hereby grants to the licensed software user the right to make copies in printed form of this documentation if provided on software media, but only for internal/personal use and in accordance with the license agreement under which the applicable software is licensed. Any copy made shall include the PTC copyright notice and any other proprietary notice provided by PTC. Training materials may not be copied without the express written consent of PTC. This documentation may not be disclosed, transferred, modified, or reduced to any form, including electronic media, or transmitted or made publicly available by any means without the prior written consent of PTC and no authorization is granted to make copies for such purposes. Information described herein is furnished for general information only, is subject to change without notice, and should not be construed as a warranty or commitment by PTC. PTC assumes no responsibility or liability for any errors or inaccuracies that may appear in this document.

The software described in this document is provided under written license agreement, contains valuable trade secrets and proprietary information, and is protected by the copyright laws of the United States and other countries. It may not be copied or distributed in any form or medium, disclosed to third parties, or used in any manner not provided for in the software licenses agreement except with written prior approval from PTC.

UNAUTHORIZED USE OF SOFTWARE OR ITS DOCUMENTATION CAN RESULT IN CIVIL DAMAGES AND CRIMINAL PROSECUTION.

PTC regards software piracy as the crime it is, and we view offenders accordingly. We do not tolerate the piracy of PTC software products, and we pursue (both civilly and criminally) those who do so using all legal means available, including public and private surveillance resources. As part of these efforts, PTC uses data monitoring and scouring technologies to obtain and transmit data on users of illegal copies of our software. This data collection is not performed on users of legally licensed software from PTC and its authorized distributors. If you are using an illegal copy of our software and do not consent to the collection and transmission of such data (including to the United States), cease using the illegal version, and contact PTC to obtain a legally licensed copy.

Important Copyright, Trademark, Patent, and Licensing Information: See the About Box, or copyright notice, of your PTC software.

UNITED STATES GOVERNMENT RIGHTS

PTC software products and software documentation are "commercial items" as that term is defined at 48 C.F.R. 2.101. Pursuant to Federal Acquisition Regulation (FAR) 12.212 (a)-(b) (Computer Software) (MAY 2014) for civilian agencies or the Defense Federal Acquisition Regulation Supplement (DFARS) at 227.7202-1(a) (Policy) and 227.7202-3 (a) (Rights in commercial computer software or commercial computer software documentation) (FEB 2014) for the Department of Defense, PTC software products and software documentation are provided to the U.S. Government under the PTC commercial license agreement. Use, duplication or disclosure by the U.S. Government is subject solely to the terms and conditions set forth in the applicable PTC software license agreement.

About This Guide

This Migration Guide is intended for users of the previous versions of Mathcad who are migrating to PTC Mathcad Prime.

How to Use This Guide

This guide supplements the PTC Mathcad Help Center. This guide assumes you are already familiar with PTC Mathcad functionality.

Use this guide to learn about converting your files from earlier versions of Mathcad to PTC Mathcad Prime. Step-by-step procedures are provided here for converting your legacy worksheets to PTC Mathcad Prime worksheets. Information on troubleshooting file conversion issues is also given.

Technical Support

Contact PTC Technical Support via the PTC Web site, phone, fax, or e-mail if you encounter problems using your software. For more information, see Opening and Tracking a Call to Technical Support in the *PTC Customer Service Guide* enclosed with your shipment. The guide is also on the PTC Support Web page at <http://www.ptc.com/support/index.htm>.

You must have a Service Contract Number (SCN) before you can receive technical support. If you do not have a number, contact PTC License Management using the instructions in your *PTC Customer Service Guide* under License Management. You can receive free technical support for the first 30 days after purchasing new software from PTC. If you do not have a SCN, you can contact technical and licensing support at http://www.ptc.com/appserver/cs/mathcad_logger/options.jsp

If you run into issues with installation or licensing, and need further assistance, go to http://www.ptc.com/support/mathcad_supportCenter.htm.

Documentation

PTC provides documentation on the product CD-ROM in the following forms:

- Help Center with context-sensitive help and tutorials
- *PTC Mathcad Prime 5.0.0.0 Read This First* in PDF format

To access the Help Center or the Getting Started Tutorial, click  or press F1. You can also click any item on the user interface Ribbon or any function in the worksheet and press F1 to open the relevant Help topic.

Feedback to Documentation

PTC welcomes your suggestions and comments on its documentation—send feedback to the following address:

mathcad-documentation@ptc.com

Please include the name of the application and its release with your comments.

Documentation Conventions

Convention	Item	Example
Bold	Buttons and other selectable elements or options from the Ribbon	Click Calculation ► Calculation Options Click Approximate Equality .
Courier	User input, system messages, directories, and file names	Processing completed.
Courier with less-than and greater-than symbols (< >)	Variables for which the user substitutes an appropriate value	output=<25

Converting Legacy Files

Before Converting	12
Using the XMCD, MCD Converter.....	12
Understanding the Conversion Results	13
Display Differences	14
Calculation Differences	27
Other Notable Differences.....	29

Legacy files are worksheets and templates that were created using previous versions of PTC Mathcad. You cannot open such legacy files directly in PTC Mathcad Prime 5.0.0.0. However, you can use the PTC Mathcad Prime 5.0.0.0 **XMCD, MCD Converter** to convert `.mcd`, `.xmcd`, and `.xmcdz` legacy worksheets to `.mcdx` format. You can also use the converter to convert legacy `.mct` and `.xmct` template files to PTC Mathcad Prime 5.0.0.0 `.mctx` format.

This chapter provides instructions for using the converter.

Note

- To convert legacy PTC Mathcad files to PTC Mathcad Prime 5.0.0.0 `MCDX` format, you must have PTC Mathcad 15.0 M045 installed. Otherwise, the converter will not function properly. You can download PTC Mathcad 15.0 M045 from:
<http://www.ptc.com/engineering-math-software/mathcad/free-trial>
 - You can use your PTC Mathcad Prime 5.0.0.0 license for PTC Mathcad 15.0 as well.
-

Before Converting

Check your legacy worksheet to see if it contains any of the following items, and then take the appropriate actions before starting the conversion process.

Locked Areas

The XMCD, MCD Converter cannot process legacy files that contain collapsed locked areas. You must unlock or expand any locked collapsed areas before converting the worksheet.

Using the XMCD, MCD Converter

1. To start the XMCD, MCD Converter, on the **Input/Output** tab, in the **PTC Mathcad Worksheets** group, click **XMCD, MCD Converter**. The converter opens.
Alternatively, you can start it from the **Start** menu.
2. Click **Add Worksheets**. The **Open** dialog box opens.
3. Browse for and select the legacy worksheets, and then click **Open**. The file names that you selected, with their full path, appear in the **Source Worksheet** column. The version of Mathcad you used to create the legacy worksheet appears in the **Version** column.
4. Click **Add References**. If the worksheet contains references to other worksheets, they appear in the converter.
5. Select the desired worksheets and click **Convert**. The conversion process starts and the **Status** changes to **In Progress**. If the conversion is successful, the **Status** changes to **Converted**, otherwise it changes to **Failed**.

For each successful conversion, the converter creates a new file with a `.mcdx` file extension in the same folder as the source file. The source file is not modified.

The XMCD, MCD Converter displays a conversion log that lists all the issues found during conversion. Click a worksheet name to see its log. The XMCD, MCD Converter stores all the log files in the directory that contains your legacy files. You can open log files with a text editor like Notepad or an XML editor.

6. Open a converted worksheet and then press **Ctrl+F5** to recalculate the worksheet and view the updated results.

 **Note**

- The worksheets generated by the XMCD, MCD Converter cannot be read by previous versions of PTC Mathcad Prime.
 - You can continue working in PTC Mathcad Prime 5.0.0.0 while files are being converted.
-

Understanding the Conversion Results

When you convert legacy worksheets, all regions that require your attention are annotated. A red line segment appears to the left of the affected region and a red arrow points to the affected region. For example, a region might contain a function with different solving algorithm, a different display, or a feature that is unsupported in PTC Mathcad Prime 5.0.0.0. Features that are not available in PTC Mathcad Prime 5.0.0.0 are converted as images, so that no information is lost. All annotated differences belong to one of the following categories:

- Display differences
- Calculation differences
- Unsupported features and formatting (not available in PTC Mathcad Prime 5.0.0.0)

To understand and handle annotated regions, perform the following steps:

1. In a converted worksheet, click an annotated region. The annotation appears below the region.
2. Read the annotation message and resolve any conversion issues.
3. After you edit all the annotated regions, on the **Input/Output** tab, in the **PTC Mathcad Worksheets** group, click **Clear Annotations**. The annotation marks disappear.

 **Note**

Clear Annotations removes all the annotations in the worksheet at once. Do not click this button until you have reviewed all the issues.

Refer to [Resolving Conversion Issues](#) for information on resolving conversion issues.

Display Differences

The display of some features is different in PTC Mathcad Prime 5.0.0.0. These display differences do not affect calculation results.

OLE Objects

Converted OLE objects have the setting “Preserve Aspect Ratio” turned ON by default.

OLE objects that were displayed as an icon in the legacy worksheet might lose their aspect ratio upon conversion.

Fractional Results and Mixed Number Formatting

The result is formatted according to the default PTC Mathcad Prime 5.0.0.0 worksheet style.

Nondecimal Expressions

In PTC Mathcad Prime 5.0.0.0, binary, octal, and hexadecimal base numbers are converted to decimal numbers.

Complex Numbers

In previous versions of Mathcad, you entered $z:=2\pi*1i$ and the displayed result was $z:=2\pi*i$, but in PTC Mathcad Prime 5.0.0.0 the displayed result is $z:=2\pi*1i$ (the imaginary unit is prefixed with the number 1). A new polar operator allows you to display complex results in polar form.

Parentheses

Some parentheses in previous versions of Mathcad that are only used for display purposes are not converted. For example, consider the following equation:

$$Q(i,j) := m_{(i,j)} + n_{(j,i)}$$

Subscripts appear without parentheses when converted by PTC Mathcad Prime 5.0.0.0:

$$Q(i,j) := m_{i,j} + n_{j,i}$$

The meaning of the resulting equation is identical.

Spaces in Variable Names

In previous versions of Mathcad, you can have spaces in variable names. When converted by PTC Mathcad Prime 5.0.0.0, each space is replaced by an underscore:

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
$f_{a\ b\ c} := 20$	$f_{a_b_c} := 20$
$f_{y\ abc} := 30$	$f_{y_abc} := 30$

Display Precision in Results

PTC Mathcad Prime 5.0.0.0 can display up to 15 decimal places in results. This affects the conversion of results.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
$\ln(2) = 0.69314718055994530$	$\ln(2) = 0.693147180559945$
Displays 17 decimal places	Displays 15 decimal places

Note

The precision of internal results is the same.

Derivatives

The display of partial derivatives is not supported in PTC Mathcad Prime 5.0.0.0. They appear as derivative operators.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
	$\frac{d}{dy_j} f_i$

Note

The partial derivative variables use literal subscripts.

Symbolic Evaluation

- Stacking of Symbolic Keywords and Modifiers

In previous versions of Mathcad, the keyword and modifier placeholders are to the left of the symbolic evaluation operator. In PTC Mathcad Prime 5.0.0.0, they are above it.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
$e^x \left \begin{array}{l} \text{series} \\ \text{substitute, } x = 2 \end{array} \right. \rightarrow \frac{109}{15}$	$e^x \xrightarrow{\begin{array}{l} \text{series} \\ \text{substitute, } x = 2 \end{array}} \frac{109}{15}$

- Programming Operator

The display of PTC Mathcad Prime 5.0.0.0 symbolic evaluation results containing programming operators appears slightly different.

Previous versions of Mathcad
$(3a - 7) \cdot x = 1 \text{ solve, } x, \text{ fully} \rightarrow \left\{ \begin{array}{l} \frac{1}{3 \cdot a - 7} \text{ if } a \neq \frac{7}{3} \\ \text{undefined if } a = \frac{7}{3} \end{array} \right.$

PTC Mathcad Prime 5.0.0.0
$(3 a - 7) x = 1 \xrightarrow{\text{solve, } x, \text{ fully}} \left\ \begin{array}{l} \text{if } a \neq \frac{7}{3} \\ \left\ \frac{1}{3 \cdot a - 7} \right\ \\ \text{else if } a = \frac{7}{3} \\ \left\ \text{undefined} \right\ \end{array} \right\ $

- Collapsed Nested Matrices

PTC Mathcad Prime 5.0.0.0 does not support the display of collapsed nested matrices in symbolic evaluation results.

Previous versions of Mathcad
$m1 := \begin{pmatrix} 1 & 2 \\ 4 & 3 \end{pmatrix} \quad m2 := \begin{pmatrix} 5 & 7 \\ 6 & 8 \end{pmatrix}$ $m4 := (m1 \ m2) \rightarrow (\{2,2\} \ \{2,2\}) = (\{2,2\} \ \{2,2\})$

PTC Mathcad Prime 5.0.0.0
$m1 := \begin{bmatrix} 1 & 2 \\ 4 & 3 \end{bmatrix} \quad m2 := \begin{bmatrix} 5 & 7 \\ 6 & 8 \end{bmatrix}$
$m4 := [m1 \ m2] \rightarrow \left[\begin{bmatrix} 1 & 2 \\ 4 & 3 \end{bmatrix} \ \begin{bmatrix} 5 & 7 \\ 6 & 8 \end{bmatrix} \right] = [[2 \times 2] \ [2 \times 2]]$

- Long Symbolic Results
In previous versions of Mathcad, long symbolic results are displayed fully and you must scroll to the right to see the full result. PTC Mathcad Prime 5.0.0.0 truncates the display of long results and places three ellipses at the truncation point. Clicking the math region displays a resize bar for making the region width smaller or larger.
- Symbolic Expressions or Keywords
Unlike previous versions of Mathcad, PTC Mathcad Prime 5.0.0.0 does not support the hiding of:
 - Left-hand side expressions
 - Keywords
- Symbolic Expressions Using the *assume* Keyword
The converter modifies the *assume=real* keyword to *assume,ALL=real* modifier:

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
$(2^b)^c \text{ simplify, assume = real } \rightarrow 2^{b \cdot c}$	$(2^b)^c \xrightarrow{\text{simplify, assume, ALL = real}} 2^{b \cdot c}$

Data Tables

In previous versions of Mathcad, data tables are used to define data sets. The table elements are entered directly by the user or imported from a file. If the table is not resized, then the display shows only the first ten elements along with three horizontal ellipses if there are more elements in the table. PTC Mathcad Prime 5.0.0.0 converts legacy data tables to matrices and the display of such matrices shows the first twelve elements along with three vertical ellipses if there are more elements in the matrix.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0																																	
<p>T2 :=</p> <table border="1"> <thead> <tr> <th></th> <th>0</th> <th>1</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>1</td> <td>4.292</td> <td>4.292</td> </tr> <tr> <td>2</td> <td>8.584</td> <td>8.584</td> </tr> <tr> <td>3</td> <td>12.875</td> <td>12.875</td> </tr> <tr> <td>4</td> <td>17.167</td> <td>17.167</td> </tr> <tr> <td>5</td> <td>21.459</td> <td>21.459</td> </tr> <tr> <td>6</td> <td>25.751</td> <td>25.751</td> </tr> <tr> <td>7</td> <td>30.042</td> <td>30.042</td> </tr> <tr> <td>8</td> <td>34.334</td> <td>34.334</td> </tr> <tr> <td>9</td> <td>38.626</td> <td>...</td> </tr> </tbody> </table>		0	1	0	0	0	1	4.292	4.292	2	8.584	8.584	3	12.875	12.875	4	17.167	17.167	5	21.459	21.459	6	25.751	25.751	7	30.042	30.042	8	34.334	34.334	9	38.626	...	<p>T2 :=</p> $\begin{bmatrix} 0 & 0 \\ 4.2918 & 4.2918 \\ 8.5835 & 8.5835 \\ 12.8753 & 12.8753 \\ 17.1671 & 17.1671 \\ 21.4588 & 21.4588 \\ 25.7506 & 25.7506 \\ 30.0424 & 30.0424 \\ 34.3341 & 34.3341 \\ 38.6259 & 38.6259 \\ 42.9177 & 42.9177 \\ 47.2095 & 47.2095 \\ \vdots & \vdots \end{bmatrix}$

7	30.042	30.042																																
8	34.334	34.334																																
9	38.626	...																																

Operators with Multiple Forms

Some operators have multiple forms in previous versions of Mathcad. PTC Mathcad Prime 5.0.0.0 uses a single operator with multiple placeholders, to make it easier to use whichever form you want. The additional placeholders can be filled in or left empty.

- Square root and Nth root

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
<p>Square Root</p> $\sqrt{3} = 1.732$	<p>Insert both the Square Root and Nth Root operators by pressing \</p> $\sqrt{3} = 1.732$
<p>Nth Root</p> $\sqrt[2]{3} = 1.732$	$\sqrt[2]{3} = 1.732$

- Derivative and Nth derivative

Previous versions of Mathcad		PTC Mathcad Prime 5.0.0.0	
Derivative		Insert both forms of the derivative operator by pressing: Ctrl+Shift+D	$\frac{d}{dx} f(x)$
Nth Derivative			$\frac{d^2}{dx^2} f(x)$

- Definite integral and indefinite integral

Previous versions of Mathcad		PTC Mathcad Prime 5.0.0.0	
Definite integral		Insert both forms of the integral operator by pressing: Ctrl+Shift+I	$\int_b^a f(x) dx$
Indefinite integral			$\int f(x) dx$

- Summation

Previous versions of Mathcad		PTC Mathcad Prime 5.0.0.0	
Summation		Insert the three forms of the Summation operator by pressing: Ctrl+Shift+\$	$\sum_{i=1}^n v_i$
Range Variable Summation			$\sum_i v_i$
			$\sum v$

- Product

Previous versions of Mathcad		PTC Mathcad Prime 5.0.0.0	
Range Variable Iterated Product		Insert both forms of the Product operator by pressing: Ctrl+Shift+#	
Iterated Product			

- Limit

Previous versions of Mathcad		PTC Mathcad Prime 5.0.0.0	
Two-sided limit		Insert all three forms of the limit operator by pressing: Ctrl+L	
Right-hand limit			
Left-hand limit			

- Symbolic Evaluation

Previous versions of Mathcad		PTC Mathcad Prime 5.0.0.0	
Symbolic Evaluation		Insert both forms of the symbolic operator by pressing: Ctrl+. (period)	
Symbolic Keyword Evaluation			

WRITEPRN and APPENDPRN Functions

The **WRITEPRN** and **APPENDPRN** functions are converted into different PTC Mathcad Prime 5.0.0.0 formats.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
$M := \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{pmatrix}$ <p>WRITEPRN("bob") := M</p> $\text{READPRN}(\text{"bob.prn"}) = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{pmatrix}$	$M := \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$ <p>WRITEPRN("bob", M) = $\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$</p> $\text{READPRN}(\text{"bob.prn"}) = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
<p>APPENDPRN("bob") := M</p> $\text{READPRN}(\text{"bob.prn"}) = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 1 & 2 & 3 \\ 4 & 5 & 6 \end{pmatrix}$	<p>APPENDPRN("bob", M) = $\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$</p> $\text{READPRN}(\text{"bob.prn"}) = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$

PTC Mathcad Prime 5.0.0.0 converts the definitions WRITEPRN("file"):=M and APPENDPRN("file"):=M to WRITEPRN("file", M)= and APPENDPRN("file", M)= respectively.

WRITECSV and WRITEEXCEL Functions

The **WRITECSV** and **WRITEEXCEL** functions are converted into different PTC Mathcad Prime 5.0.0.0 formats.

Previous versions of Mathcad
$\text{WRITECSV}(M, \text{"excelcsvMC15.xlsx"}) = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{pmatrix}$ $\text{WRITEEXCEL}(M, \text{"excelMC15.xlsx"}) = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{pmatrix}$

PTC Mathcad Prime 5.0.0.0
$\text{WRITECSV}(\text{"excelcsvMC15.xlsx"}, M) = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$
$\text{WRITEEXCEL}(\text{"excelMC15.xlsx"}, M) = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$

PTC Mathcad Prime 5.0.0.0 swaps the first two arguments.

Excel Components

Excel components have a new format in PTC Mathcad Prime 5.0.0.0. When you convert a legacy Excel component, the converter adds input and output expressions to fit the new format.

Whether created from an external file or from typing in data, Excel components are treated identically by the converter. If the converted Excel component is linked to an external file, the converter embeds the data inside the Excel component. The converted worksheet is not linked to the external file.

An Excel component that is displayed as an icon in previous versions of Mathcad is converted to an Excel component with a single cell displayed.

Note

You must have Excel 2003 or later installed for the conversion to work properly.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0																																
<p>Excel component with no inputs and outputs.</p> <table border="1" data-bbox="341 436 769 554"> <tr> <td></td> <td>1</td> <td>2</td> <td>3</td> </tr> <tr> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td></td> <td></td> <td></td> <td></td> </tr> </table>		1	2	3									<p>Excel component with empty Inputs area and Outputs area.</p> 																				
	1	2	3																														
<p>Excel component with inputs and outputs. x is the input variable. y is the output variable.</p> <p>$y :=$</p> <table border="1" data-bbox="399 970 786 1369"> <tr> <td></td> <td>1</td> <td>0</td> <td>0</td> </tr> <tr> <td></td> <td>0</td> <td>1</td> <td>0</td> </tr> <tr> <td></td> <td>0</td> <td>0</td> <td>1</td> </tr> <tr> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td></td> <td></td> <td></td> <td></td> </tr> </table> <p>x</p>		1	0	0		0	1	0		0	0	1																					<p>The inputs and outputs are converted to input and output expressions.</p> 
	1	0	0																														
	0	1	0																														
	0	0	1																														

Other notable differences for Excel components are listed here:

- In previous versions of Mathcad, when you open the Excel component table, the Excel ribbon is a part of the Mathcad menu. In PTC Mathcad Prime 5.0.0.0, a separate Excel window opens to show the full Excel component table.
- If a component table in the legacy file contains the value of NaN , the converter

changes the cell's value to blank. Like any other blank cell, if you assign a blank cell to an output variable, its value is 0.

- PTC Mathcad Prime 5.0.0.0 does not support the use of an Excel component to define functions. If a legacy file contains a function definition that depends on an Excel component, the conversion fails.

Converted Text

Text is converted properly when your display is set to 96 DPI. If your display is set to 120 DPI, then the converted file might contain text that wraps onto more than one line.

Disabled Regions

In legacy files a disabled region is marked with a black square. When converted, the disabled region appears grayed out.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
$D := \text{"Disabled Legacy Math Region"}^{\blacksquare}$	$D := \text{"Disabled Legacy Math Region"}$

Areas

PTC Mathcad Prime 5.0.0.0 supports the collapsing and protection of areas. It also supports the optional locking of the area display state.

If the legacy file contains a protected area that is locked and collapsed, the conversion fails. You must unlock or expand such areas before conversion. For every other case, you must re-protect the area in the converted worksheet.

Page Layout

You can view the PTC Mathcad Prime 5.0.0.0 worksheet with or without grid lines. By default PTC Mathcad Prime 5.0.0.0 opens in page view in which your worksheet appears as a series of pages with grid lines. The nonprintable continuous space that is visible on the right side of the legacy Mathcad worksheets is hidden. To view the nonprintable space, click the **Draft View** icon  in the bottom right of the status bar or under the **Document** tab. To view a print preview of your worksheet, click the **Page View** icon . If you want to make your page view larger, choose a different page size or adjust the margins under the **Document** tab. You can also preview your pages by saving them to XPS (XML Paper Specification) or printing them to PDF directly from PTC Mathcad Prime 5.0.0.0.

Global Definition Operator

Legacy Mathcad allows the use of multiple global definitions of the same variable, including inside solve blocks. PTC Mathcad Prime 5.0.0.0 limits you to a single global definition of the same variable and it must be placed outside solve blocks.

- If your legacy worksheet has a global definition operator inside a solve block, then upon conversion the global definition operator is moved to outside the solve block.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
$x := 1$ $y := 1$ Given $glo_def \equiv 99$ $x^2 + y^2 = 6$ $x + y = 2$ $\begin{pmatrix} xval \\ yval \end{pmatrix} := \mathbf{Find}(x, y)$ $glo_def = 99$	<p>The converted worksheet shows the global definition $glo_def \equiv 99$ moved outside the solve block, indicated by a red arrow. The solve block contains the equations $x^2 + y^2 = 6$ and $x + y = 2$, and the $\mathbf{Find}(x, y)$ function call. The result $glo_def = 99$ is shown below the solve block.</p>

The converted worksheet has no errors. Read the annotation message before clearing it.

- If your legacy worksheet has multiple global definitions of the same variable, then opening the converted file shows no errors. However, if you recalculate the worksheet, then the two global definitions and their two evaluations report errors.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0	
$x \equiv 3$	$x = 3$	$x \equiv 3$
$x = 3$	$x = 3$	$x = ?$
$x \equiv 5$	$x = 5$	$x \equiv 5$
$x = 5$	$x = 5$	$x = ?$

The converted worksheet has errors. Resolve the issue by removing the extra global definition operators.

- If your legacy worksheet contains a global definition of a variable and a reference to another worksheet that contains a global definition of the same variable, then upon conversion and recalculation an error is flagged by all regions.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
$x \equiv 7$	$x \equiv 7$
 Reference:D:\2nd_level.xmcd(R)	include << D:\2nd_level.mcdx
$x = 3$	$x = ?$

The converted worksheet has errors. To resolve the issue you must open the included worksheet to decide which of the global definition operators you should remove.

Equation Break Operator

PTC Mathcad Prime 5.0.0.0 supports equation breaking but does not support the insertion of equation break operators in range variables.

Calculation Differences

TOL and CTOL

PTC Mathcad Prime 5.0.0.0 uses the *KNITRO* optimization solvers. This means that tolerances for solve block functions **find**, **minerr**, **minimize** and **maximize** are set internally. Unlike previous versions of Mathcad, you no longer need to set *TOL* in a solve block.

Note

With PTC Mathcad Prime 5.0.0.0 the *KNITRO* optimization solver sets the tolerances internally when you use functions **minimize** and **maximize** outside a solve block.

CTOL continues to control the constraint satisfaction tolerance for functions **find** and **minerr**.

Clearing the Previous Value of a Variable

In previous versions of Mathcad, the expression $x:=x$ was used to clear the previous symbolic value of x while leaving the numeric value intact. The **XMCD**, **MCD Converter** converts the legacy expression $x:=x$ to the new PTC Mathcad Prime 5.0.0.0 function **clear_{sym}(x)**.

Units

PTC Mathcad Prime 5.0.0.0 has dynamic unit checking. This means that units are checked while functions are processed. In Mathcad 12 through 15, units are checked first and then processed.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
$f(x) := 1 + m$ $f(1) =$	$f(x) := 1 + m$ $f(1) = ?$
An error on the function definition indicates that the units do not match.	An error only appears after the function is evaluated.

Dynamic checking gives more flexibility, so some expressions that produce an error in earlier versions of Mathcad work properly in PTC Mathcad Prime 5.0.0.0. For example, in Mathcad 12 through 15, you cannot define a program or function that depends on a numeric value to determine the units of output.

$$f2(x) := \begin{cases} cm^2 & \text{if } x < 0 \\ cm^3 & \text{otherwise} \end{cases}$$

But in PTC Mathcad Prime 5.0.0.0, the program works as expected:

$$f2(x) := \text{if } x < 0 \begin{cases} cm^2 \\ \text{else} \\ cm^3 \end{cases}$$

Note

This program contains the if/else operator, which replaces if/otherwise.

Solve Blocks

Solve blocks in PTC Mathcad Prime 5.0.0.0 are clearly defined regions within a solve block box. You do not need the word *Given* to mark the start of a solve block. Guess values, constraints, and solvers are labeled for clarity. All regions inside the solve block construct can move as one unit. For more information on solve blocks, refer to the Help and the Solving Tutorial for PTC Mathcad Prime 5.0.0.0.

The following restrictions apply to solve blocks:

- You cannot use a global definition operator inside a solve block.
- You cannot include a range loop above the solver function inside a solve block. You can have a range variable but not a range loop such as this:

$$i := 1 .. 10$$

$$x_i := i$$

- You cannot include any definitions inside an ODE solve block, that is, a solve block containing **odesolve**.
- PTC Mathcad Prime 5.0.0.0 does not support symbolic evaluation of functions inside solve blocks. If your legacy worksheet contains symbolic evaluations then upon conversion they are moved outside the solve block.

Worksheet Calculation

Earlier versions of Mathcad open by recalculating all results, and you can choose to save the file with results stored or unstored.

PTC Mathcad Prime 5.0.0.0 does not recalculate the results when you first open the file, so if results were stored, they will show in the file. When you edit a file, the results are recalculated. When you edit results, the results are always recalculated.

Other Notable Differences

DOE Functions

- In PTC Mathcad Prime 5.0.0.0, the ordering in the **fullfact**, **fractfact** and **boxwilson** functions is based on *The National Institute of Standards and Technology (NIST)* standard. In previous versions of Mathcad, the ordering is based on *Understanding Industrial Designed Experiments/Book and Disk-Excel [Hardcover]* by Stephen R. Schmidt and Robert G. Launsby.
- In PTC Mathcad Prime 5.0.0.0, the result of **boxwilson** is displayed as a matrix, whereas in previous versions of Mathcad it is displayed as a table. The accuracy of the result is not affected.

Previous Versions of Mathcad				
$\text{fullfact}(2) =$	"Run"	"Block"	"A"	"B"
	1	1	-1	-1
	2	1	-1	1
	3	1	1	-1
	4	1	1	1

PTC Mathcad Prime 5.0.0.0				
$\text{fullfact}(2) =$	"Run"	"Block"	"A"	"B"
	1	1	-1	-1
	2	1	1	-1
	3	1	-1	1
	4	1	1	1

Previous Versions of Mathcad

$$\text{fractfact}(3, 1) = \begin{pmatrix} \text{"Run"} & \text{"Block"} & \text{"A"} & \text{"B"} & \text{"C=AB"} \\ 1 & 1 & -1 & -1 & 1 \\ 2 & 1 & -1 & 1 & -1 \\ 3 & 1 & 1 & -1 & -1 \\ 4 & 1 & 1 & 1 & 1 \end{pmatrix}$$

PTC Mathcad Prime 5.0.0.0

$$\text{fractfact}(3, 1) = \begin{bmatrix} \text{"Run"} & \text{"Block"} & \text{"A"} & \text{"B"} & \text{"C=AB"} \\ 1 & 1 & -1 & -1 & 1 \\ 2 & 1 & 1 & -1 & -1 \\ 3 & 1 & -1 & 1 & -1 \\ 4 & 1 & 1 & 1 & 1 \end{bmatrix}$$

Greek Letters in Text Regions

To insert a Greek letter inside a PTC Mathcad Prime 5.0.0.0 text region, first type the equivalent Latin character, then select the typed letter and change its font to **Symbol**. Alternatively, insert the character from the Character Map program under Accessories.

You can also copy a variable name containing Greek symbols from a math region to a text region.

Apostrophe and First Derivative Operator in Math Regions

To insert an apostrophe inside a PTC Mathcad Prime 5.0.0.0 math region, simply type ‘ (apostrophe). To insert the first derivative (prime operator), type Ctrl+’.

Previous Versions of Mathcad	PTC Mathcad Prime 5.0.0.0
$f(x) := x + 1$	$f'(x) := x + 1$
Insert an apostrophe by pressing the ` (back quote).	Insert an apostrophe by pressing the ‘ (apostrophe).

Images

PTC Mathcad Prime 5.0.0.0 does not have a Picture tool. To display an image that results from processing an input image, save the new image to the current working directory and on the **Math** or **Document** tab, in the **Regions** group, click **Image**. Click **Browse for Image...** to locate and insert your image.

2

Resolving Conversion Issues

Region Placement	34
Worksheet Calculation	34
Functions	36
2D Plots	37
3D Plots	44
Contour Plots	54
Headers and Footers	55

When you convert a legacy worksheet to PTC Mathcad Prime 5.0.0.0 format, the converted file may contain visual or calculation issues that require your intervention. Use the information in this chapter to learn how to resolve file conversion issues.

Region Placement

The worksheet conversion process may result in some regions overlapping other regions. This can be caused by one or more of the following reasons:

- Difference in page size
- Difference in font size and style
- Little or no space between regions in the legacy worksheet
- Excel component display differences
- Matrix display differences

Resolution

Click near the top of the page in the PTC Mathcad Prime 5.0.0.0 worksheet. On the **Document** tab, in the **Spacing** group, click **Separate Regions** and then select **Vertically** or **Horizontally**.

Worksheet Calculation

The worksheet conversion process might run into math regions that it cannot resolve or plot regions that it cannot convert. The converter turns such regions into images with appropriate annotations so none of your original content is lost.

Note

The converter cannot process legacy files that contain collapsed, locked areas. Unlock or expand such areas before converting them.

Numerical Zero

Converting legacy worksheets that contain expressions with units, such as $0/1s + 2m/1s$, that ran error free might yield an error in PTC Mathcad Prime 5.0.0.0.

This is because to implement dynamic unit checking (*DUC*) in a more flexible manner, PTC Mathcad Prime 5.0.0.0 must assume that the 0 in $0/1s$ is unitless and therefore $0/1s$ has dimension $1/time$ (for example, frequency). Therefore adding frequency $0/1s$ to velocity $2m/1s$ will correctly result in an error because the units are not compatible.

To resolve this error, replace the unitless 0 with a zero of dimension m to indicate that it represents length. Thus, $0m/1s + 2m/1s = 2 m/s$ as expected.

Note

To provide more control over how numeral 0 should behave, PTC Mathcad Prime 5.0.0.0 provides two built-in constants:

- *zero* (lowercase) — Represents dimension less 0. For example, $zero + 1m$ yields an error whereas $0 + 1m = 1m$

Use variable *zero* to ensure that the quantity is always checked for correct dimension, even when it has a magnitude of 0.

- *Zero* (uppercase) — Represents 0 of any quantity. It assumes whatever unit is required by the computation. For example, $Zero * m + Zero * s = 0$

Use variable *Zero* to simulate compatibility with legacy Mathcad treatment.

It is recommended that you always specify the desired unit with every magnitude in mixed unit expressions.

Built-In Variables

When your legacy worksheet contains a built-in variable whose value is defined on the **Calculation** tab, in the **Worksheet Settings** group, you must define that variable at the top of your converted worksheet. For example, if the value of *ORIGIN* in your legacy worksheet is 2, you type $ORIGIN:=2$ at the top of your converted worksheet.

Result Formatting

Result formatting differences do not affect the accuracy of results, but some results may look different in your converted worksheet because the following options are different in PTC Mathcad Prime 5.0.0.0:

- Results formatting: Complex threshold, zero threshold, exponential threshold, fraction, exponents in engineering format, format units, hexadecimal, octal or binary display.
- Show unit exponents as a fraction
- Display precision: PTC Mathcad Prime 5.0.0.0 supports display precision of up to 15 decimal places.
- Matrix display style

 **Note**

When you open a worksheet in PTC Mathcad Prime 5.0.0.0, the results are not recalculated automatically. You must press Ctrl+F5 to recalculate the worksheet and view the actual results in PTC Mathcad Prime 5.0.0.0.

Functions

lu, qr, and cholesky Matrix Decomposition Functions

The legacy **lu**, **qr**, and **cholesky** matrix decomposition, or factorization, functions have been replaced with **LU**, **QR**, and **Cholesky**, respectively. The new case sensitive functions offer enhanced capability in terms of performance and stability, full pivoting and complex support, and no limitation of input matrix dimensions.

The following table highlights the differences between the two groups of functions:

 **Note**

Similar names are used for the output matrices of the legacy functions and their new counterparts, but the form or contents of such matrices are not necessarily similar or equal. Apply a legacy function and its counterpart to the same input matrix and observe the differences in the resulting outputs.

	Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
Syntax	lu(M)	LU(M)
Input matrix	Real or complex square matrix	Real or complex mxn matrix
Return array	Three augmented square matrices— P , L , and U	A vector containing three nested matrices— P , L , U
Equation	$P \cdot M = L \cdot U$	$P \cdot M = L \cdot U$
Syntax	qr(M)	QR(M,[p])
Input matrix	Real mxn matrix	Real or complex mxn matrix
Return array	Two augmented matrices— Q and R	A vector containing three nested matrices— P , Q , R
Equation	$M = Q \cdot R$	$M \cdot P = Q \cdot R$

	Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
Syntax	cholesky(M)	Cholesky(M,[p,[u]])
Input matrix	Real positive definite square matrix. (assumed to be symmetric)	Real positive definite square matrix Or: Complex Hermitian definite square matrix
Return array	One square matrix— L	A vector containing two nested matrices— P, L
Equation	$M = L \cdot L^T$	$P^T \cdot M \cdot P = L \cdot L^T$

2D Plots

Waterfall Plot

When the y-axis is a matrix of multiple columns, legacy Mathcad plots one trace per column:

After you convert the worksheet and perform the actions below, PTC Mathcad Prime 5.0.0.0 displays the plot as follows:

Perform one of the following actions:

- XY plot—When the number of columns of x is greater than y (as in the plot on the right), a trace is plotted for each column in the x axis expression. You must delete the extra columns in x if you want this plot to look exactly as the legacy plot.
- Polar plot—Plot the columns one at a time with one y -axis expression per vector.

Secondary Y Axis

When your legacy plot contains a secondary y -axis, the plot is converted as follows — assuming the tick marks of the first y -axis were user-defined:

Opening the converted file shows an annotated plot but no traces. The annotation message explains that the secondary y -axis is not supported in the current version of PTC Mathcad Prime 5.0.0.0, and that all traces have been converted to the primary y -axis.

After Conversion

To resolve the issue, do the following:

1. Clear the annotation.

Only the primary trace is visible. The secondary trace is not visible because the range of the primary axis is 4–6 while the range of the secondary axis is -0.5 – 0.5 .

2. Define the maximum and minimum of the two traces:

$$f1(x) := \sin(x) + 5$$

$$f2(x) := 0.5 \cdot \cos(2 \cdot x)$$

$$f1Max := 6$$

$$f2Max := 0.5$$

$$f1Min := 4$$

$$f2Min := -0.5$$

3. Scale the missing trace as follows:

$$y(x) := \left(\frac{f1Max - f1Min}{f2Max - f2Min} \right) \cdot (0.5 \cdot \cos(2 \cdot x)) + \left(f1Min - \left(\frac{f1Max - f1Min}{f2Max - f2Min} \right) \cdot f2Min \right)$$

 **Note**

You can use the above scaling formula for plots with a normal scale, but not for plots with a logarithmic scale.

- Evaluate $y(x)$ symbolically to see the symbolic result of the scaling.

$$y(x) \rightarrow 1.0 \cdot \cos(2 \cdot x) + 5.0$$

- Plot the original function and the newly scaled one.

The two traces now appear as they do in the legacy plot.

Plots with Units

PTC Mathcad 15.0 does not fully support units in plots. You can place values with units in plotted expressions, limits, and markers, but Mathcad does not perform unit checking. Mathcad uses the magnitude of values converted by default to SI units, or to the unit system you set for the worksheet.

$$t := 0s, 1s.. 10s \quad v_0 := 10 \frac{m}{s}$$

$$v(t) := v_0 - g \cdot t$$

$$v(2s) = -9.613 \frac{m}{s}$$

If you wish to scale the y-axis of the PTC Mathcad 15.0 plot and view velocity in terms of kilometer per hour, you must divide the plotted function $v(t)$ by kph :

With PTC Mathcad Prime 5.0.0.0, you can plot functions and data with units, and Mathcad scales the axes values appropriately.

Type the vertical and horizontal expressions $v(t)$ and t and Mathcad inserts the units into the unit placeholders automatically.

To view velocity in terms of kilometer per hour, select the unit placeholder and type *kph*.

If your legacy plot contains markers or tick marks with units, after conversion you must remove the unit to clear the error.

Plotting Two Range Variables

When your legacy worksheet contains a plot with two range variables, the conversion result is as follows:

Legacy Plot	After Conversion
<p><code>j := 0..5 i := 0..4</code></p>	<p><code>j := 0..5 i := 0..4</code></p>

To resolve the issue, define vectors v_x and v_y above the converted plot:

$$v_x := \left| \begin{array}{l} \text{for } j \in 0..5 \\ \left| \begin{array}{l} \text{for } i \in 0..4 \\ \left| \begin{array}{l} v_{x,j,i} \leftarrow i \end{array} \right. \end{array} \right. \end{array} \right| \end{array} \right|$$

$$v_y := \left| \begin{array}{l} \text{for } j \in 0..5 \\ \left| \begin{array}{l} v_{y,j} \leftarrow j \end{array} \right. \end{array} \right| \end{array} \right|$$

Replace j and i in the plot with vy and vx .

 **Note**

This solution only applies to XY plots.

3D Plots

In previous versions of Mathcad, you can insert various types of 3D plots in your worksheet. In PTC Mathcad Prime 5.0.0.0, scattered data, curves, and surfaces are converted to a single type of 3D plot.

Mathcad converts the tick mark values according to their settings in the legacy plot. When the plot displays a function, the converter calls **CreateMesh** or **CreateSpace** to capture its original ranges, including its start and end points, as well as its number of intervals.

After you open the converted file in PTC Mathcad Prime 5.0.0.0, you do not need to keep the call to **CreateMesh** or **CreateSpace**. You can obtain an identical looking plot by typing the function name directly in the axis expression and then by editing the tick mark values, by editing the number of grids points, or by defining range variables above the plot.

Functions of Two Arguments with Default Starts and Ends

When a legacy plot displays a function of two arguments with default starts (-5) and ends (5), the converter does not need to add arguments to **CreateMesh** or **CreateSpace** to define the lower and upper bounds of the plotted range.

In previous versions of Mathcad, the number of plotted points is defined as the number of grids (or intervals). However, in **CreateMesh**, the number of plotted points is defined as the number of grid points. The converter must add +1 to the number of intervals to preserve the original plotted range.

 **Note**

The default plotted range in PTC Mathcad Prime 5.0.0.0 is (-10, 10). When changing the **Number of Points** on the Ribbon, you are changing the number of grid points and not the number of intervals.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
A function of 2 arguments with 5 intervals in the x- and y-direction. The intervals are defined in the Properties dialog box under the QuickPlot tab.	After conversion, the plot displays CreateMesh with 12 points in the x- and y-direction.
$f(x,y) := \frac{x}{y}$  <p data-bbox="349 1438 373 1480">f</p>	$f(x,y) := \frac{x}{y}$  <p data-bbox="860 1417 1071 1459">CreateMesh(f, 12)</p>

In this example, due to the singularity at (0, 0), the function can only be plotted with an odd number of intervals as seen in previous Mathcad versions, or with even number of points as seen with **CreateMesh** in PTC Mathcad Prime 5.0.0.0.

After conversion, you may want to remove **CreateMesh**. For the example above, you can proceed as follows:

 **Note**

In this particular case, plotting the function returns an error due to the singularity at (0,0). To fix this, replace the division operator with a multiplication operator and go through step 2 before changing back the operator to division.

1. In the z-axis expression, replace *CreateMesh(f, 12)* with *f*.
2. On the **Plots** tab, in the **Traces** group, change the **Number of Points** to 12.
3. Edit the minimum and maximum tick mark values of x-axis and y-axis to -5 and 5.

f

Functions of Two Arguments with User-Defined Starts, Ends, and Number of Intervals

When a legacy plot displays a function of two arguments with user-defined starts and ends or number of intervals, the converter adds arguments to **CreateMesh** or **CreateSpace** to define the lower and upper bounds of the plotted range and number of grid points.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
<p>A function of 2 arguments with 25 intervals in the x-direction and 30 intervals in the y-direction. The plotted range of x is (-10, 0) and the plotted range of y is (0, 15). The intervals are defined in the Properties dialog box under the QuickPlot tab.</p>	<p>After conversion, the plot displays CreateMesh with the corresponding plotted range. There are 26 points in the x-direction and 31 points in y-direction.</p>
<p>$f(x,y) := x \cdot y$</p>  <p>f</p>	<p>$f(x,y) := x \cdot y$</p>  <p><code>CreateMesh(f, -10, 0, 0, 15, 26, 31)</code></p>

After conversion, you can replace $CreateMesh(f, s_0, s_1, t_0, t_1, sgrid, tgrid)$ with $f(x,y)$ where x and y are defined as range variables above the plot:

1. Calculate the step sizes x_s and y_s using the following equations:

$$s_0 := -10$$

$$s_1 := 0$$

$$sgrid := 26$$

$$t_0 := 0$$

$$t_1 := 15$$

$$tgrid := 31$$

$$x_s := s_0 + \frac{s_1 - s_0}{sgrid - 1} = -9.6$$

$$y_s := t_0 + \frac{t_1 - t_0}{tgrid - 1} = 0.5$$

2. Define x and y as range variables.

$$x := s0, x_s..s1$$

$$y := t0, y_s..t1$$

3. In the z-axis expression, replace $CreateMesh(f, -10, 0, 0, 15, 26, 31)$ with $f(x,y)$.

$$f(x, y) := x \cdot y$$

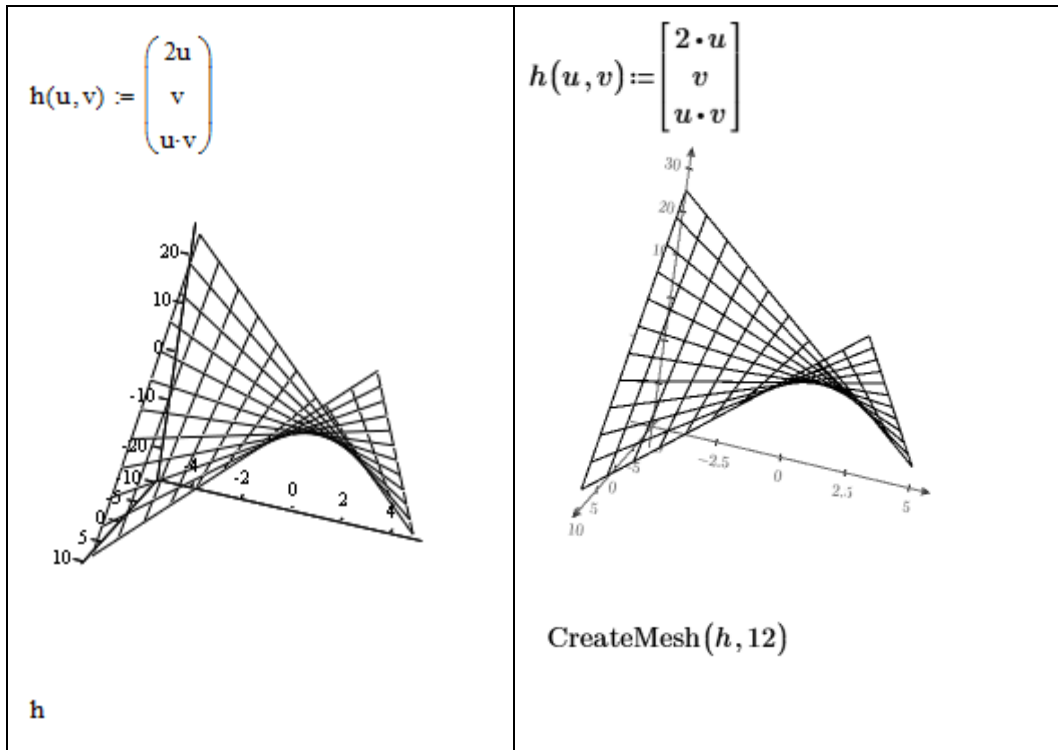

$$f(x, y)$$

Vector-Valued Functions

Vector-valued functions in legacy plots are converted the same way as functions of two arguments. The plotted range is captured by the arguments of **CreateMesh** or **CreateSpace**.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
A function defining a parametric surface with 11 intervals. The plotted ranges of x and y are (-5, 5).	Mathcad uses CreateMesh to plot the function after conversion, with the corresponding range and grid points.

To remove the call to **CreateMesh**, use the same procedure as described in the previous section where range variables are defined above the plot.

1. Calculate the step size:

$$u0 := -5$$

$$u1 := 5$$

$$grid := 12$$

$$u_s := u0 + \frac{u1 - u0}{grid - 1}$$

2. Define the range variables:

$$u := u0, u_s .. u1$$

$$v := u$$

3. Replace *CreateMesh(h, 12)* with *h(u, v)*.

$h(u, v)$

Combined Inputs

In previous versions of Mathcad, you can combine inputs with parentheses or vectors, instead of defining inputs one by one, separated by commas, as is done in 2D plots. In PTC Mathcad Prime 5.0.0.0, you must define each input in a separate z-axis expression. Mathcad converts combined inputs in such a way as to preserve the look of the converted plot as close as possible to the legacy plot.

For example, given the following combined input, the conversion works as shown below.

$$i := 0..5 \quad j := 0..10$$

$$M_{i,j} := 0.1 \cdot i \quad N_{i,j} := j \quad P_{i,j} := 2 \cdot i \cdot j \quad Q_{i,j} := 3 \cdot i \cdot j$$

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
 <p data-bbox="357 840 406 882"><i>(M)</i></p>	 <p data-bbox="860 840 893 882"><i>M</i></p>
 <p data-bbox="357 1449 438 1491"><i>(M,N)</i></p>	 <p data-bbox="860 1417 893 1459"><i>M</i></p>

 <p data-bbox="267 865 370 898">(M, N, P)</p>	 $\begin{bmatrix} M \\ N \\ P \end{bmatrix}$
 <p data-bbox="272 1507 402 1541">(M, N, P, Q)</p>	 <p data-bbox="776 1486 808 1663">M N P Q</p>

Bar Plots

Bar plots are not supported in PTC Mathcad Prime 5.0.0.0. They are converted to surface plots.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
<p data-bbox="354 359 521 386">$f(x,y) := x + y$</p>  <p data-bbox="354 863 370 890">f</p>	<p data-bbox="844 359 1011 386">$f(x,y) := x + y$</p>  <p data-bbox="870 894 1068 921">CreateMesh(f, 21)</p>

Patch Plots

Patch plots are not supported in PTC Mathcad Prime 5.0.0.0. They are converted to 3D Scatter plots.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0
<p data-bbox="354 1234 493 1262">$f(x,y) := x \cdot y$</p>  <p data-bbox="354 1745 370 1772">f</p>	<p data-bbox="844 1213 1000 1241">$f(x,y) := x \cdot y$</p>  <p data-bbox="870 1749 1068 1776">CreateMesh(f, 21)</p>

Cylindrical and Spherical Coordinate System Plots

In previous versions of Mathcad you can plot data in a cylindrical or a spherical coordinate system. PTC Mathcad Prime 5.0.0.0 converts a cylindrical or a spherical coordinate system plot to an image.

3D Plots Size

When you convert a legacy worksheet that contains a wide or a narrow plot, the converter resets the plot to a cube.

Previous versions of Mathcad	PTC Mathcad Prime 5.0.0.0

Contour Plots

With contour plots you can view 3D data in a 2D plot. Each contour represents a z value.

The contour function supports a number of input data formats. One such format is a vector of three nested matrices, $[X Y Z]^T$, representing the x-, y-, and z-coordinates.

The conversion of a legacy contour plot into a PTC Mathcad Prime contour plot fails if the input data format is a vector of three matrices and coordinate matrix X or Y is not rectangular. In some cases, the conversion succeeds even in the presence of a non-rectangular matrix, but the resulting plot is different than the plot in the legacy worksheet.

For matrix X to be rectangular, all values in a single row must be the same, and values in row R must be larger than values in row $R-1$:

$$X = \begin{bmatrix} -5 & -5 & -5 & -5 & -5 & -5 \\ -4.474 & -4.474 & -4.474 & -4.474 & -4.474 & -4.474 \\ -3.947 & -3.947 & -3.947 & -3.947 & -3.947 & -3.947 \\ -3.421 & -3.421 & -3.421 & -3.421 & -3.421 & -3.421 \\ -2.895 & -2.895 & -2.895 & -2.895 & -2.895 & -2.895 \\ -2.368 & -2.368 & -2.368 & -2.368 & -2.368 & -2.368 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \end{bmatrix}$$

Similarly, for matrix Y to be rectangular, all values in a single column must be the same, and values in column C must be larger than values in column $C-1$:

$$Y = \begin{bmatrix} -5 & -4.474 & -3.947 & -3.421 & -2.895 & -2.368 \\ -5 & -4.474 & -3.947 & -3.421 & -2.895 & -2.368 \\ -5 & -4.474 & -3.947 & -3.421 & -2.895 & -2.368 \\ -5 & -4.474 & -3.947 & -3.421 & -2.895 & -2.368 \\ -5 & -4.474 & -3.947 & -3.421 & -2.895 & -2.368 \\ -5 & -4.474 & -3.947 & -3.421 & -2.895 & -2.368 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \end{bmatrix}$$

Headers and Footers

Legacy worksheet header:

PTC {f}	PTC Mathcad {p}	Migration Guide {nn}
---------	-----------------	----------------------

Conversion output:

PTC {f}	PTC Mathcad [p]	Migration Guide {nn}
---------	-----------------	----------------------

The following table outlines the legacy header and footer syntax and the equivalent command on the PTC Mathcad Prime 5.0.0.0 **Document** tab, in the **Headers and Footers** group. Use the table to replace the legacy syntax character with the equivalent PTC Mathcad Prime 5.0.0.0 header or footer field.

Legacy Syntax	Description	PTC Mathcad Prime 5.0.0.0 Command
{f}	Insert file name	File ▶ Name
{p}	Insert file path	File ▶ Path
{n}	Insert page number	Page Number with choices
{nn}	Insert number of pages	Page Number with choices
{fd}	Insert date last saved	Saved Date
{ft}	Insert time last saved	Not available
{d}	Insert current date	Not available
{t}	Insert current time	Not available

The following header and footer customization options are not available in PTC Mathcad Prime 5.0.0.0:

- Changing the number of the first page
- Using a different header and footer on first page
- Using a frame around the header, footer, or main worksheet

 **Note**

- You may need to resize images or format text to keep the content within the header or footer.
 - If your header is too wide to fit, change the margins to wide margins.
-

Supported and Unsupported Features

This appendix provides a comprehensive list of supported and unsupported features for PTC Mathcad Prime 5.0.0.0.

A number of Mathcad functions have been deprecated, and their support will be phased out in future PTC Mathcad Prime releases. Refer to the Help Center for a list of deprecated functions and suggested alternate functions to use in converted or newly created worksheets. Deprecated functions work properly when the worksheets that contain them are converted to PTC Mathcad Prime 5.0.0.0 format. They can also be used in PTC Mathcad Prime 5.0.0.0 directly, but are not documented in the Help Center.

Feature	In PTC Mathcad Prime 5.0.0.0
New Ribbon	
Ribbon user interface based on Microsoft Office	✓
Customizable Quick Access Toolbar	✓
Physical constants in the Ribbon	✓
Features and functionality are more visible and not hidden in menus and dialog boxes	✓
Calculation	
Multithreading	✓
System Support	
64-bit operating system support	✓
Units	

Feature	In PTC Mathcad Prime 5.0.0.0
Dynamic units	✓
Mixed units in matrices and tables	✓
Mixed units in plots	✓
Choice of MKS, None, and customized unit systems	✗
Most functions now accept units	✓
Functions	
Localized function and keyword names	✗
Two new and more flexible Fourier transform functions	✓
24 new Design of Experiments (DOE) functions that support units	✓
Data Analysis, Signal Processing, and Image Processing Extension Pack functions added	✓
Improved performance for computational signal and image functions	✓
Most functions now accept units	✓
New Read/Write functions: READCSV and WRITECSV , READEXCEL and WRITEEXCEL , READTEXT and WRITETEXT	✓
Advanced KNITRO 7.0 optimization software library for minimize and maximize solvers	✓
New clear variable definitions function for numeric and symbolic expressions	✓
Math and Equation Editor	
Choice of solving algorithms	✗
Custom currency symbols	✗
Definition and evaluation on the same line	✓
Equation break	✓
Error tracing	✓
Explicit evaluation feature	✓
Hexadecimal, octal, and binary number format	✗

Feature	In PTC Mathcad Prime 5.0.0.0
Included worksheets can be cached for portability	✓
Literal subscripts can be inside a variable name like H ₂ O	✓
Math styles	✗
Mixed numbers (fractions)	✗
Multilevel worksheet references (include referenced files inside another worksheet)	✓
New improved equation editor showing structure of the math	✓
New Labels feature for using the same names for different elements, such as <i>m</i> for meters and <i>v</i> for variables.	✓
Pdesolve and PDE solve blocks	✗
Result Formatting Tolerance: Zero and complex threshold	✗
Number format: Show exponents as E±000	✗
Solve blocks as a block that can be moved as a grouped regions with a border	✓
Solve blocks contain local variables.	✓
Symbolic math (except for menu symbolics, symbolics in solve blocks, and symbolic result formatting)	✓
Large symbolic results are truncated and can be resized to view as much of the result as desired	✓
Matrices and Vectors	
Add and delete rows and columns from the Ribbon or with the mouse	✓
Insert matrix with desired rows and columns from the Ribbon	✓
Matrix navigator for panning and resizing large matrices	✓
Mixed units in matrices	✓
Operators	
Custom display of operators	✗
Custom operators, prefix and postfix operators	✗

Feature	In PTC Mathcad Prime 5.0.0.0
Direct substitution of operators by overtyping	✓
Global definition	✓
Gradient operator	✗
Indefinite integral	✓
New linear and circular convolution operators	✓
New polar operator	✓
New row operator for matrices	✓
Picture operator	✗
Scalar operator	✓
Square root and nth root operator combined into one operator	✓
Two derivative operators combined into one operator with multiple placeholders	✓
Two product operators combined into one operator with multiple placeholders	✓
Two summation operators combined into one operator with multiple placeholders	✓
Two-sided, left-hand, and right-hand limit operator combined into one operator	✓
New Is Element Of comparison operator	✓
Plots	
2D plots; traces: line, column, bar, stem, waterfall, error, box, effects	✓
Animation, vector field plot, 3D bar, 3D patch, second y-axis	✗
Box plot	✓
Contour plots (improved)	✓
Effects plot	✓
Hide axis expression	✓
Line markers (unlimited number)	✓

Feature	In PTC Mathcad Prime 5.0.0.0
Mixed units in plots	✓
Pareto plot	✓
Polar plots	✓
Plot legends, titles, embedded regions	✗
3D plots: spin, pan, zoom	✓
3D plots: surfaces, curves, scattered plots	✓
2D plots: trace and zoom	✗
Waterfall plots and plotting matrices	✓
Chart Component: A region for better visualization and presentation of your XY data using the customization options found in the new chart user interface.	✓
Programming	
Debugging tools	✗
Easier editing of programs	✓
Mathsoft controls and web controls	✗
New programming operators: if/else-if/else and if/also-if/else	✓
Programming operators can be inserted by typing	✓
Document Features	
Align regions horizontally and vertically	✗
Auto save	✗
Collapsed areas	✓
Copy worksheet regions to clipboard	✓
Copy worksheet regions to WORD	✓
Compare worksheets	✗
Draft view and page view display	✓
E-books	✗
Embedded math in text	✓
Find and Replace	✓

Feature	In PTC Mathcad Prime 5.0.0.0
Find all and replace all	✘
Grid with two display settings	✓
Hyperlinks	✘
Improved headers and footers	✓
Insertion of OLE objects	✓
Landscape pages	✓
Locked areas	✓
Math and text formatting	✓
Multiple tabbed worksheet interface	✓
Paste special	✘
Print to XPS and PDF	✓
Math and text region background color	✓
Region border	✘
Ruler and guidelines	✘
Save to RTF	✓
Separate regions vertically or horizontally	✓
Spell check	✘
Tab to different regions	✓
Templates	✓
Text blocks that push down other regions	✓
Text styles	✘
Tile worksheets	✘
View regions	✘
Wide pages in draft view	✓
Worksheet protection	✘
XMCD, MCD Converter (single or batch) for converting previous versions of Mathcad worksheets to PTC Mathcad Prime 5.0.0.0 with annotated differences	✓
Documentation	

Feature	In PTC Mathcad Prime 5.0.0.0
New Help with bookmarks and math that can be copied to PTC Mathcad Prime 5.0.0.0 worksheets	✓
New tutorials	✓
Migration Guide for converting older worksheets to PTC Mathcad Prime 5.0.0.0	✓
Detailed tooltips	✓
Tables	
Insert a table with desired rows and columns from the Ribbon	✓
Add and delete rows and columns by using the Ribbon or keyboard shortcuts	✓
Tables include a header row for listing units	✓
Each column can contain values of different units	✓
Define multiple variables with vectors and units	✓
Integration with other applications	
Microsoft Excel 2003, 2007, 2010 support	✓
Excel add-in	✗
Import or paste from Excel	✓
READEXCEL function with preview and ability to edit function for parametric processing	✓
PTC Creo Parametric integration	✓
PTC Windchill Workgroup Manager integration	✓
Excel Component	✓
Automation API	✓
SDK (Software Development Kit)	Supported, but available separately.
User-defined DLLs	✓
User-defined scripts	✗
