# Unpacking the Internet of Things

Google Home - Speaker Assistant

---

---

# What is it?

The voice controlled device can play music, control other connected devices, and give you a personalised break down of your day

---

# Integration & Connectivity

Google home is partnering with many other smart device companies to create personal home assistant. Turning on the lights, the heat, and locking the door can all be done simply by speaking to it,

---

# What's Inside?

The bottom of Home contains three speakers: one facing forward and two on the sides.

The bottom fabric cover can be changed, with various materials and colours available.

---

# Controls

Home allows for voice or touch control.

The top of Home is touch sensitive and has two holes for the microphones. Tapping on the top pauses the music or cancels the current action while sliding your finger in a circular pattern adjusts the volume.

---

# How Google Helps

Google assistant uses built in encyclopedias and databases to answer your questions, help track businesses, locations, and other everyday facts.

Linking up the assistant speaker will transform your home into a smart phone.

Google continues to add new products to the list that work with the speaker
