WHAT IS AMAZON ECHO?

- Echo is a bluetooth speaker designed by Amazon that you can control with your voice (who you also refer to as Alexa)
- At only 9.3 in tall it is very portable and only requires a wall outlet to be plugged into in order for it to work
- Echo can also connect online so that you can listen to music from a variety of popular music services such as Spotify, Pandora, iHeartRadio or can sync to your phone and play songs of iTunes

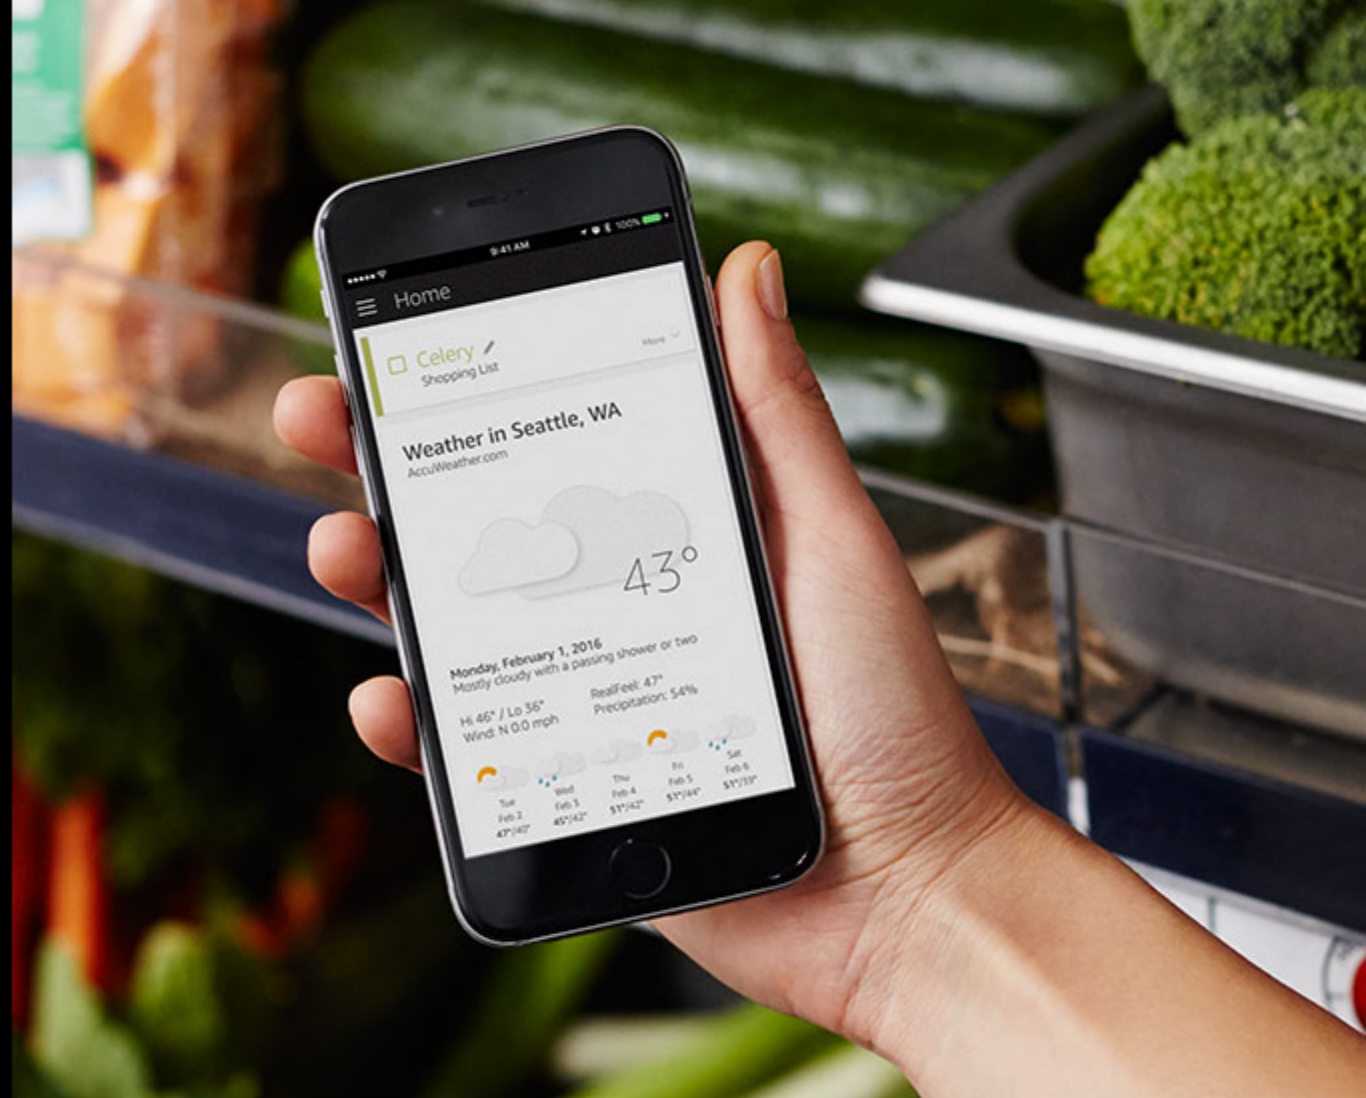

ECHO HAS SKILLS

- The capabilities the Echo has are constantly updated, so the more you use it, the smarter Echo becomes in terms of how well it recognizes your voice and the constant addition of new features
- Ordering food, requesting an Uber, and asking for the weather are some of the few things that Echo is capable of doing
- Another function Echo has is control over your home all by the sound of your voice (However these devices need to be smart compatible as well)
- You can turn on the TV just by saying: “Alexa, turn on the TV”

DO MORE WITH THE

ALEXA APP

- By using the Alexa App you can expand the capabilities of the Echo by connecting it to third party apps and devices, so I could sync my smart TV to the app and instead of controlling the TV through a remote, I could control it using my voice
- The Echo also helps out Amazon because more people are encouraged to buy Amazon Prime, Amazon music and Amazon Video because of the ease of access between all entertainment sources
