

Helmet Concussion Sensor

By: Amy Robbins

Problem:

Concussions are dangerous and causing more problems than people originally thought, especially in football.

Solution

- shockbox developed a technology that can be installed in a helmet and records the magnitude and direction of the force and can send this information to a smartphone. This allows coaches to monitor up to 128 players.

IOT

- Shockbox took a physical entity that players already wore and added a sensor so it can become a tool to monitor concussions and save lives.
