

Q. My doubt is like suppose we have data in pie chart like 4 data (section) each section have some Number (Values)

for example:

Pie chart data

Class	Student
class 8	2
class 9	4
Class 10	6
class 11	8

in this pie chart we have 4 class student (8, 9, 10, 11) each having Number 2, 4, 6, 8 (student Number)

and each class have its own data like if user select class from pie chart it will give him information about 8 class in a grid widget format similarly if he click on 9 he will navigate the information of class 9 in grid format and so on.

for example the class Information table ^(Grid) will look like for class 8

class 8th data

STid	Name	Add
1	N1	A1
2	N2	A2

↓
Grid data

Similarly if he click on class 9 he will navigate in another window showing 9th class info in Grid form

class 9th data

STid	Name	Add
11	N11	A11
22	N22	A22
33	N33	A33
44	N44	A44

Grid data

Similarly if he click on class 10th he will navigate to another window (Tab) showing 10th class Information

Class 10th
data

SIId	Name	Add
111	N111	A111
222	N222	A222
333	N333	A333
444	N444	A444
555	N555	A555
666	N666	A666

Similarly for class 11- as well. I have this work 8.5 version
Please help me to implement this kind of feature in thing work

My thinking: I am thinking to create Infotable for each class having same data shap then writing services for each class to get the data then bind it with pie chart Now I am confused like how this selection of pie chart will work like how will I navigate ~~to~~ after I select one portion for this I tried navigation function and bind it with double click property of pie chart but it is not selecting a particular section like whenever I select it will redirect me to the one target window only so please help me in this if possible.

Class 11th data

S.Id	Name	Add	Mob
1	A	A1	2
2	B	A2	3
3	C	A3	Z
4	D	A4	P
5	E	A5	Z
6	F	A6	X
7	G	A7	M
8	H	A8	n
